Where
can I obtain?

THE difficulty of not knowing exactly where you can secure some special line needed for the garden — probably recommended or seen elsewhere—is easily overcome by utilising the services of "G.I."

Considerable care over a number of years has been given to tabulating information on all aspects of gardening that shall prove of assistance to our readers.

Write us, therefore, when you want to know where to obtain any seeds, plants, shrubs, horticultural implements, sundries, or other accessories to the garden that you do not see advertised in our pages.

Address your enquiry, with stamped envelope for reply, to—

The Manager,
"Gardening Illustrated,"
Bouverie House, Fleet Street,
London, E.C. 4

CARBOKRIMP Reg'd
THE EFFICIENT WINTER WASH

"FERRY" BRAND
Regd. *Tde. Mk.*

GARDEN MANURE

"FERRY" Garden Manure is an organic manure for general purposes. Suitable for Flowers, Fruits, and Vegetables. Replenishes the soil with the important plant foods. Apply 2 to 3 ozs. per square yard and dig it into the soil NOW.

W. F. H., Haverfordwest, reports: "*Runner Beans 15 ins. long when picked, not selected . . . Parsnips 3 ft. 2 ins. . . . Carrots 2 ft. 9 ins. The Peas were excellent, 12 peas to the pod. The results have been magnificent.*"

14 lbs., **3/9**; 28 lbs., **6/6**; 56 lbs., **12/-**; 1 cwt., **21/6**

"FERRY"
HUMUS MANURE

is the only satisfactory substitute for Stable Manure. It improves the physical condition of the soil and enriches it with the important plant foods. It is equally valuable for heavy and light soils. Not to be confused with cheap Hop Manure. Contains 10% Phosphates.

J. W., Liverpool, writes: "*I have had the best all-round crops on the land.*"

28 lbs., **4/6**; 56 lbs., **7/6**; 1 cwt., **12/-**

Obtainable from Nurserymen, Seedsmen, Stores, etc., or C.P. from the Makers for cash with order.

THE BRITON FERRY CHEMICAL & MANURE CO., LTD. (Dept. C), Briton Ferry. (Est. 1886.)

Ricardi Irises: A Warning and an Appeal

This article will be eagerly welcomed by many lovers of bearded Irises, but it is likely to provoke criticism, and we hope correspondence, from those anxious to defend their pet race of Irises

DURING the last few years Iris growers have encountered a difficulty which is increasing in intensity year by year, nd, in the interests of amateur gardeners, it necessary that a warning be given at once. he matter is of some urgency because the ajority of those who order from catalogues re unaware of the trap which is lying in ait for them, and some, even, of those who re following the modern developments in ises are sometimes hard put to it to apply eir knowledge.

The trouble is at new varieties erived from rosses between is Ricardi and ther bearded Irises re being raised in ver-increasing umbers and put nto commerce ithout any warning that they are nsuitable, generlly speaking, for utdoor culture in ost parts of this ountry.

There has been, nd still is, some onfusion between Ricardi, I. ypriana, and I. esopotamica. xperts are not greed, but the iews held by Mr. ilkington, the ecretary of the Iris ociety, receive a rge measure of cceptance, and ay, for all practical purposes, be dopted by amateur gardeners, at least until ey are modified by some new accessions of nowledge. Mr. Pilkington apparently olds that the three are distinct but allied ecies, although in one place he does refer I. Mesopotamica as a form of I. Ricardi. ome raisers, *e.g.*, Foster and Hort, have sed I. Cypriana to a considerable extent in eir hybridising, and several American isers are using I. Mesopotamica, but the reatest recent development arises out of the se of I. Ricardi as a parent.

I. Ricardi certainly came to Europe from Syria and, as a native (possibly) of that hot, dry country, does not find itself at home in England, and sulks accordingly. Unfortunately, nearly all of its derivatives do likewise, and it is no comfort to English gardeners to know that these varieties are happy with Mons. Denis in the south of France, and are actually rampant growers and free flowering in the gardens of Countess Giulia Senni in Rome.

The lovely pale mauve Iris Mdlle. Schwartz

Tall and free flowering, it is one of the refined race of Ricardi Irises that with a little protection appears to have a good chance of success in English gardens

The characteristics of the Ricardi hybrids are tall stems, large flowers, late habit of blooming and delicacy of constitution. The difficulty of cultivating them here is not lessened by their tendency, given a suitable soil and aspect, to grow steadily throughout the winter, with the consequence that they run the risk of being cut down by spring frosts, only to recover when it is too late to produce flowering stems. The tall stems are flexuous and the weight of the heavy flowers is often too much for them, so that it is not unusual for the stems to bend and eventually sprawl on the ground.

Some growers are hopeful that in these hybrids we shall in time secure the ideal, tall, bearded Irises, with perfect form, large flowers, horizontal or flaring falls, strong stems, clear colours, and, perhaps, two crops of flowers in the season. They point out that some of them have accommodated themselves fairly well to English conditions, and, of course, it is quite possible that the present weakness may be bred out. But there is a considerable distance to go yet if we may judge by the experiences of those who are at present cultivating them to any extent. For example, Mr. Baker says that in his Kent garden he finds it difficult to keep them alive for more than two years, Mrs. Murrell declares that at Orpington they are almost a complete failure, and Mr. Pilkington (Lancashire), who is growing them better than anyone else in England, has to give them the protection of specially designed frames. In America, Mr. Wister and Mr. Schreiner declare that they cannot get on with them. On the other hand, it is only fair to mention that Mr. Long had considerable success with them in his Surrey garden without taking any special precautions. He has exhibited fine spikes of Mons. Cornuault, and speaks well of Mme. Durand. Mr. Sadler is another member of the Iris Society who, at Streatham, does not find it necessary to make any differentiation in his treatment of Ricardis.

On the whole, it appears that it would be well to put Ricardi derivatives in a class by themselves. Let the Iris Society declare a separate classification and request nurserymen to group Ricardis in their catalogues under one heading, with a warning note that they are hardly suitable for outdoor culture. The rating of these Irises, too, should be a subject for discussion. My own opinion is that it should be held in abeyance until it is possible to judge a fair number of varieties which, like Fismes, Troost, and Mdlle. Schwartz, seem to have a good chance of success in our gardens. Whether Cypriana and Mesopotamica derivatives should also be included in this special section is doubtful. American growers find a difficulty in growing and flowering Sir Arthur Hort's Cypriana hybrids in the northern half of the United States, but the same difficulty does not appear to have been experienced here, at all events not to any marked extent. Mohr and Mitchell, in America, have used I. Mesopotamica freely, and their introductions are beginning to be seen in England. It is to be hoped that their constitution is better than that of the Ricardi hybrids, but it is alarming to find that some of the American growers are already sounding a warning note with regard to them.

So far as I have been able to trace, the following Ricardi hybrids are in commerce. I should be glad to be informed of any errors in the list or omissions therefrom. Avril, Algol, Arsace, Boréal, Carthusian, Clement Desormes, Flavescens Ricardi, Fismes, Gargantua, General Galliéni, Gernez, Henri, Hestiones, J. B. Dumas, Jussieux, Lepinoux, Leverrier, Mme. Cecile Bouscant, Mme. Chabal, Mme. Claude Mounet, Mme. Durrand, Mme. J. Vernoux, Mme. Lamouche, Menetrier, Mdlle. André Autissier, Mdlle. Schwartz, Micheline Charraire, Miss Cawell, Mons. Brun, Mons. Chaber, Mons. Cornuault, Mons. Hautefeuille, Mons. Hubert, Mons. Massé, Mons. Olivier Perthuis, Perdita, Renée Denis, Renée Laborde, Ricardi blanc bleuté, R. foncé, Saüll, Silva, Souv. de Lœtitia Michaud, Troost.

The bird bath in frosty weather

IN times of severe frost birds not only suffer from hunger and cold, but also from thirst. When lakes and ponds are frozen over a small portion is kept open, and any ice broken each morning. Any small vessel, such as a bird bath, containing water is always liable to be cracked by frost, as the formation of ice brings a considerable pressure to bear on the sides. It may be saved from damage by placing an empty stone jar in the water within the bird bath with the neck downwards and kept from touching the bottom by allowing it to rest on four flat pieces of stone. The inverted jar is, of course, filled with air, but this is compressed when the water freezes, and acts like a cushion, so relieving the pressure of the ice on the bird bath. When constructing large receptacles to contain water the sides should not be made perpendicular, but slightly sloping, so that the top is larger than the bottom. If this rule was observed many a troublesome crack and leak would be avoided. Fountains and more elaborate constructions should be emptied and care taken that no snow accumulates or rain-water allowed to freeze. The protection of the bird bath is assured in an easy way by the above simple method.

Anchusa myosotidiflora

In defence of Anchusa myosotidiflora (pa
770 of GARDENING ILLUSTRATED), it is obvi
that "An Amateur of Hardy Flowers"
growing this moisture-loving plant un
hopeless conditions. Probably he has one
those dry, tidy, weedless, English bord
which fill us western Irish with amazeme
Let him move the abused plant to a wet
not dark part of his garden and see
difference if the plant is not too far gone
recover.

I have given this Anchusa to Engl
friends, and scarcely recognised it in th
gardens as the same plant. Here it is
soil which at this moment (December 2
one might fairly call mud, but I know t
next year during April, May, and June
will be a mass of feathery plumes, som
yard long, thickly covered with its small s
blue flowers and impervious to the late fr
which injure modern Forget-me-nots.

I consider that its only drawback is its s
each plant in congenial conditions taking
a lot of room, and it is here as unsuitable
a herbaceous border as a Megasea would

A lump of suet for the blue tits

They have been feeding on insects all the summer and autumn and they deserve a little help in these lean days

Robins like chopped Almonds, cheese, mealworms, biscuit crumbs, and currants ay I beg your correspondent, if he has not suitable damp position, to give it to some riend who has. The individual flowers are mall, but so are those of Astilbes.

Co. Fermanagh. W. L. C.

—— I should like to suggest to " An mateur of Hardy Flowers " that the reason e fails with Anchusa myosotidiflora is that e plants it in ordinary, perhaps rich, garden oil. I put one or two in the herbaceous order, but quickly took them out as they ere practically all leaf. Now I grow quan-ties in the wilder part of the rock garden. n sandy, dry, poor, very poor, soil, and ere the leaves are small, the flowers stand p high above them in sheets of blue, and ey last for weeks. They are universally dmired. A sloping bank of them with ielytra formosa below and Grape Hyacinths among the latter forms a charming picture.

Godstone. N. S. C.

Berberis Wilsonæ as a wall plant

AS a reader of your valued paper I think the enclosed snap might be of interest to you—viz., Berberis Wilsonæ, grown s a wall plant on my entrance porch here, nd which, I think, one rarely sees grown this manner. The photograph was taken n December 7th when the berries were, ossibly, just past their best. It was, how-ver, amply furnished and most effective. nfortunately, I am not expert enough at hotography to have brought out the full eauty of the shrub or do it full justice. s the aspect of the position is full south, little imagination only is needed to com-lete the picture. J. SUTCLIFFE PYMAN.

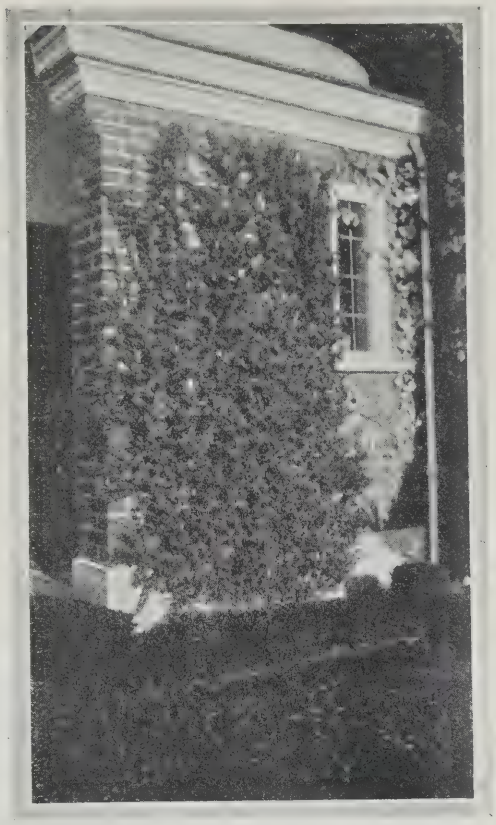
Norsebury, Sutton Scotney, Hants.

Potato crops

In GARDENING ILLUSTRATED, December 1st, Adam " gives a few interesting particulars f a crop of King Edward VII. Potatoes more than 3 cwts. of Potatoes from 14 lbs. f seed). The crop is certainly very good, nd credit is due to him.

Some years ago I was very interested in he cultivation of vegetables, and, on the hole, was very successful. Looking up ome records of Potato crops recently, I ame across the following. I am now going ack to 1910 and 1912, the seasons when the rops were grown.

Previous to 1910 I had been growing a ariety of Potato called New Guardian, a econd early or mid-season variety, which ad done exceptionally well with me for everal years, so I decided to test its cropping nd table qualities with a view to recording he results. The variety was sent out by essrs. Webb, of Stourbridge, a few years rior to 1910, and they described it as a onderful cropper, of first-class table quality, nd a good disease resister. These qualities ere all borne out by the test. The test was n ordinary one made with a view to its use-ulness in the ordinary way of cultivation. he ground was bastard trenched (double-ug) during the winter months, incorporating t the same time a liberal dressing of stable anure. The seed was sprouted previous to lanting. The resultant crop was obtained rom 8 lbs. of seed Potatoes planted on April th and lifted on September 17th, yielding 45 lbs. in weight, or an average of 30 lbs. 0 ozs. to each pound of seed planted. All he tubers were of a suitable size for use, here being an absence of very small tubers, he few of which were not included in the eight stated. Two years later (1912) I grew he same variety again on the same plot of round, treating it in precisely the same anner as before. This time I planted 4 lbs. of seed, the crop being lifted on Sep-ember 3rd, and weighed 4 cwts., or an aver-ge of 32 lbs. to each pound of seed planted.



Berberis Wilsonæ as a wall plant

The crop was grown on a plot of ground which was previously a part of the kitchen garden of Bournville Hall, at Bournville.

J. L.

Rock gardens at Chelsea Show

I am glad to see that Mr. Dillistone's letter in your issue of December 8th, criticising Col. Durham's communication *re* rock gardens at Chelsea Show, has been answered by Mr. Wood, than whom no one is better qualified to write. I do not propose to refer either to Mr. Dillistone's or Mr. Wood's letters, except to say that what the former calls the " inherent virtue " of mountain limestone is the ease with which it is laid compared to sandstone. A few cartloads of limestone tipped on to the ground out of a cart would almost make a passable " rockery," whereas sandstone demands very careful laying, and this rock garden exhibitors have found out, with the result that limestone is used at Chelsea *ad nauseam,* and I am not surprised that the public is getting sick of it. It would be both interesting and instructive if Mr. D. would show us at Chelsea next year what he can do with some stone other than mountain limestone.

I would like, also, to make one remark on what Mr. Wood says about the giving of awards. If he and other exhibitors are really of opinion that the true artist's style is cramped by the thought that through the ignorance of the judges he may not get the award to which he thinks he is entitled, then let them petition the Council to refrain from making awards, and I feel sure that their wishes would receive every consideration from what one of your correspondents calls the benevolent old gentlemen who form the R.H.S. Council. M. F.

—— I have been much interested in the various letters which have appeared in your paper with reference to the rock gardens at Chelsea. Possibly, some readers may know that shortly after the last show I wrote an article in the horticultural Press stating that, in my opinion, and in the opinion of many of the friends to whom I have spoken, it would be desirable that a fresh site should be allocated by way of a change for the rock garden exhibits, as the exhibits of late appear to merely provide a repetition of mountain gorges.

I pointed out that there are many who desire rock gardens but who are not fortunate to possess a sloping bank or undulating ground, and that, consequently, if the site of the rock garden at Chelsea were changed, the results would be more varied and more educational both from the point of view of the amateur and the professional gardener. I feel sure that a change of environment would of itself suggest the possibilities of other types of stones, and that there would not be the repetition of style which has been so obvious of recent years.

At the present time I am engaged in the construction of a large rock garden at Southsea, and I realised before the work commenced that it would not be possible to follow the dogma, " Use local stone or none at all," for the simple reason that there is no natural rock within a distance of 50 miles. The selection of suitable rock, however, was quite a problem, but I ultimately chose a limestone from Gloucestershire, although I had strong leanings to Purbeck, which I have proved to be exceedingly good for this purpose.

Sometimes my cogitations induce me to soliloquise as to who the experts were who first stated that " rock gardens were primarily for Alpine plants." This, in my opinion, is a fallacious doctrine, as in our own country and in Alpine countries one sees plants growing in the meadows where no rocks abound and the same genera and species of plants growing in other localities amongst rocky scenery.

There are some, also, who would not dare to plant a tender plant in the rock garden, but who have no scruples as to using it in formal beds amongst other plants of a hardy character. Yet are there not many plants from tropical and sub-tropical countries the natural habitat of which is amongst stones of the lowlands?

In the rock garden which I am constructing my chief object will be to grow as representative a collection as possible from the littoral of our own or any other country in temperate regions, as I believe these would be more appropriate than plants from high elevation, although if these care to thrive at approximately sea-level they will not be rejected. F. BAKER,
Parks Superintendent.

Portsmouth.

—— I am afraid both Mr. Wood and myself will be justly accused of saying very little of importance in many words. Although it might be amusing it is neither necessary or profitable to follow him through all the devious paths he treads in his inconsistent contribution to your columns of December 22nd.

I shall continue to pay Mr. Wood the tribute of judging the excellence of his taste and work by what he *does* rather than by what he *says.* From 1912 to 1927, inclusive, he had 14 opportunities of doing what he says ought to be done, and using a rock other than grey limestone for an exhibit at Chelsea Show. Once he did so (1915, I think), and although I should not characterise his effort as the " lamentable failure " to which he says all great artists are subject, it was, in my opinion, the least attractive of his many wonderful achievements. Is it unfair to surmise that he recognised this and, on subsequent occasions when he exhibited, remained true to his first love?

I have used the word inconsistent. He is tired of a stone "the facility with which one gets the *same old* pretty effects," but has continued to use it "*varying considerably* the form of my exhibits from year to year."

After describing the results achieved at the International Show, 1912, as "a mixture and chaos of thought," "some very beautiful and others—astonishing," he says "there was bound to come something good." I presume he means (as he is writing after the event) that it *has* come. The result is that from "mixture and chaos of thought" we have arrived by a gradual process of evolution at what he now describes as "our annual monotonous display." So he says of the letter that gave rise to this correspondence: "It is obviously an effort—to make a forward move that should have been made long since." A forward move to what? If Mr. Wood is right it is backwards to "mixture and chaos of thought."

There is much in Mr. Wood's letter that I am incapable of understanding, but to *me* (it may not be so to others) the most inexplicable sentence of all is the one in which he says "the rock garden section of our big show has a mission far greater than the mere bringing together a group of rock builders for the purposes of competition." What is that mission? Is it pride of achievement? It is there, but is hardly a "mission." Is it without thought of reward to interest, amuse, or educate the public? This might be a "far greater mission," and if it is Mr. Wood's I respect his altruism. But neither Mr. Wood, myself, nor anyone else believes for one moment that an exhibitor at Chelsea has such an object in view. He is there with the sole object of impressing the visiting public with the superiority of his own conception and workmanship over that of his competitors. He does this with the sole idea of gaining (obviously at the expense of his rivals) business that will feed, clothe, and house him and his during the following year. Every exhibit has "strictly business" for its motive. If this is a "mission far greater" than the friendly rivalry that enters into a competition for an award of no intrinsic value and the sporting acceptance of the referee's decision, even though one believes a mistake has been made, it is beyond my comprehension.

I know Mr. Wood does not mean to proclaim the gospel of "Art for Art's sake" at Chelsea Show. He is much too sincere for that.

Mr. Wood chooses to read into my remarks a personal opinion that no other stone is suitable for the construction of a rock garden. Nothing I have ever said justifies this. My contention is that the present condition of affairs must be due to selective forces working on the minds of exhibitors. By a natural process they seem to have arrived at the same conclusion. Are they all right or all wrong? They *have,* and have always had, that "one big free field for self-expression." There has never been any rule compelling exhibitors to use any particular material. It was this very fact that the Secretary's letter suggested the time had come to tell exhibitors what to use that called forth my (perhaps ill-advised) remarks. If the exhibitors are not all wrong or all right who is wrong and who right?

There is one remark of Mr. Wood's that sounds clever, and perhaps for that reason its applicability is not quite clear to me. "If you ask an artist which is the ideal colour," etc. If Mr. Wood moves in a circle in which a remark that certain colours are most suitable for certain purposes evokes an invitation to drink, his artist friends are hospitable creatures, but are they better artists?

Mr. Wood first quarrels with my remark that the grey limestone is "eminently suitable for small rock gardens," and then says, "It is just as suitable for large ones." Of course it is! And there are not many rocks that have this dual and facile capacity.

Of all Mr. Wood's desires, which, summarised, appear to be freedom of expression, freedom to use any material one chooses, freedom to experiment, freedom to use 20 different sorts of stone in one exhibit if he so chooses, he and every other exhibitor has had them all for years. The only freedom that he will never attain so long as there are two exhibitors left is freedom from "competition" in a more acute form than mere "awards" impose.

GEO. DILLISTONE.

Chimonanthus fragrans (Winter Sweet)

Chimonanthus fragrans is a remarkable and delightful shrub. It was introduced from Japan in 1766. The common name, "Winter Sweet," lends a certain charm to the fragrance of its flowers, their perfume being diffused around when the shrub is in bloom. From its flowers it derives the name of "Winter Sweet." Another name is the "Japanese Winter Flower." It is also known as Calycanthus præcox, a synonym under which it is occasionally listed. It is a deciduous shrub growing about 8 feet high in the open, of a compact and bushy habit. Although perfectly hardy, it is advisable to give it the shelter of a wall, on which it can be trained, in the more exposed and colder parts of the country, when it will grow considerably higher than that mentioned above. As previously stated, the flowers are deliciously fragrant, produced usually in December and January, earlier or later, according to the state of the weather at this time of the year. The flowers are solitary, disposed at the joints of the previous summer's shoots; the colour of the flowers is a yellowish-green, the inner petals being smaller and purplish. The sprays when cut are exceedingly useful for indoor decoration displayed in large vases in association with some hardy evergreen subject.

Chimonanthus fragrans (the Winter Sweet)

When grown in the open very little
pruning is required, but when growing on
wall it is essential that pruning should
resorted to annually. This consists
shortening back the stronger growths and
entire removal of the weaker shoots. T
should be done immediately after floweri
not later than February, in order that as lo
a season as possible may be allowed for
development of the new shoots on which
produced next winter's flowers. This shr
does very well on a wall with a southern
western aspect. I have seen it doing exc
tionally well in the open in that m
favoured part of the country, Bournemou
where it grows and flowers annually with
greatest freedom. This, however, should
deter anyone from growing this delight
shrub, as it is quite hardy, and in the col
districts of the country needs only the p
tection of a wall, or some other shelter
enable it to produce its flowers most fre
at a time when very few shrubs are in bloo
namely, mid-winter.

There is also a variety, C. f. grandiflor
with larger flowers of a purer yellow colo
The flowers of this variety are more shov
but their fragrance is not so pronounced
in the type. The shrub is generally lar
in all its parts, and grows somewhat talle

Propagation is effected by means of lay
and seeds; cuttings are very difficult to ro

Sternbergia lutea

On page 811 two letters are printed, in
of which "C. T. K." tells us that if we w
Sternbergia lutea to flower we must on
account disturb the bulbs when once plant
In the second letter Mr. S. Arnott, on
other hand, advises us to take the bulbs
every year in order to ripen them off. Un
the circumstances it might be of interest
other readers to know of my experience h
in the Exeter district of Devon. Last y
(1927) I obtained 12 bulbs from Veit
planted them as soon as they arrived, and
flowered in October, if I remember right
which is somewhat early. So far this agr
with Mr. Arnott. In a garden close by
friend of mine flowers Sternbergia lutea y
after year; the bulbs are never disturbed
far as I know. This year, notwithstandi
the very hot, dry summer in a very hot,
garden, these bulbs did not flower nearly
well as usual. Mine did not flower at
though they were left undisturbed with
exception of one or two, which were
turbed accidentally while searching for ot
bulbs. They are planted in a very warm a
in summer excessively dry corner of the g
den under a hedge facing due west.
seems a pity that a plant which is so intere
ing both geographically and historica
should be so difficult to flower. Perhaps t
is the reason why Sternbergias are so rar
met with in gardens. It has been suggest
that these are the "Lilies of the field"
the Bible. Both Clusius and Parkins
cultivated them, and the latter called th
"the great autumn Daffodils."

EDWARD CAHEN

Proposed Society of Garden Architect

Let us be independent of the red tape
established Societies. May I suggest t
the most practical way of forming a rea
representative Society is for garden arc
tects of all varieties, whatever their soc
status, theoretical or practical qualificati
—and these rightly vary immensely—shou
write Mr. Sudell at 9, Gower Street, W.C.
as he has proposed (see issue December 8
page 779). The thing that matters
genuine interest in and ability for the wor
Eventually a meeting of those interest
could be arranged for the evening of t
second day of the Chelsea Show, one of t

few days possible for the majority to be present. HUGH E. SEATON.

Merriott, Somerset.

—— The correspondence in your journal about the proposed Society of Garden Architects is interesting, and much good should come of it, though a better word than "architect" might be found. My training and my sympathies lie in the direction of architecture, but I fear that too often an architect's design for a garden shows too much stonework and ornament, and very little knowledge of trees and plants, the important units of the design; mere drawing-board stuff and more architecture than gardening. The other extreme is the average nurseryman's arrangement, showing an intimate knowledge of his living material, but very little conception of form or colour. But of the two give me the latter. At least, it is human and unpretentious, and comparatively inexpensive. The ideal happens, no doubt, in those rare cases where the architect is a fanatical gardener, or the gardener is a man of taste and invention.

There are many things such a Society could educate us in. Colour, for example. How many professional gardeners know the first thing about colour? Occasionally a writer in your columns expresses refined horror at what he calls "loud" or "crude" colours (meaning merely bright or clear colour) and showing a virtuous preference for what he refers to as "soft" colours and "pastel shades" (meaning, usually, dingy and washed-out tints). Heaven forbid that one should shock their sensibilities by planting a drift of magenta-coloured flowers (this colour seems to be considered ill-bred for some reason or other), but the accomplished artist can find a use and a place for all colours and tones in their proper proportions, and no colour is unclean when handled with discrimination. A spot of flaring magenta in certain circumstances can be as splendid as a trumpet-note in a symphony. Some attempt might also be made to raise the standard of production in what are known as "garden ornaments"—figures, bird baths, etc. The quality of design, especially in concrete examples, is pretty low, and many people whose homes contain fine furniture and porcelain have to accept a lower ideal in choosing their garden decorations.

This country is justly proud of its preeminence in horticulture. Our garden designers might very readily raise certain factors to a higher level still if their efforts were united. JOHN ADAMS, A.R.C.A.

Campanula Miranda

I am very glad to see Mr. Watson's letter citing Farrer, who proves that the name of Campanula Bellardii Ten. has precedence over C. pusilla Haenke. A little botanical light on nomenclature is all for the good, though I feel that there is much doubt as to whether gardeners will take up the name. Can anyone tell us now what C. cæspitosa is? I have always understood it to be synonymous with C. pusilla, but do not know which has priority.

A. H. WOLLEY-DOD.

Cytisus præcox

THIS fine hybrid Broom is a splendid subject for growing in groups and masses. Treated in this manner it is exceedingly effective when in bloom. It has a distinct, graceful, and bushy habit, ultimately reaching a height of about 5 feet. The flowers are produced in great profusion along the slender shoots in April and May of a sulphur-yellow colour. Known also as the Warminster Broom, on account of its having had its origin at the latter place. Unfortunately, the flowers are possessed of an unpleasant odour, which detracts somewhat from its usefulness for planting near to dwellings. On the other hand, it is a most pleasing sight when in full bloom viewed from a distance.

The illustration shows one of several groups that were originally planted on the edge of a plantation of trees and shrubs. J. L.

Cytisus præcox, a splendid subject in groups and masses

December Roses

Correspondents have been sending you at various times throughout November accounts of the wonderful variety of plants in bloom in their gardens, and that, if you please, in the sub-tropical counties of Hampshire, Kent, and Essex. If your correspondents saw what things are blooming in the open ground in the bracing hyper-borean climate of Inverness—not in November, which, after all, is but a late autumn month, but in December, the month of the Winter Solstice (which, thank heaven, took place yesterday), they would save their ink for garden facts really worth writing about. I am not going to follow the example of your loquacious correspondents, but will only say that I have in the house at the present date (December 22nd) a bowlful of quite beautiful Roses of the choicest kinds from the open border—Mme. Butterfly, Lady Pirrie, Chatenay, etc. In this cool—though not exactly cold—weather I expect them to last over Christmas. If plants continue this disregard for times and season we shall have to think seriously of changing their names. If Helleborus niger will bloom in November what is the use of calling it the "Christmas Rose"? Various forms of H. orientalis began pushing up heads of bloom early in December. It is surely an absurd misnomer to call these Lent Roses (not Lent Lilies as one of your contributors calls them, the Lent Lily being a Daffodil). Whether it is the flowers that are playing false to their several natures or our Inverness climate that is displaying its geniality at the wrong season it is hard to say, but clearly there is something out of joint. A. W.

Inverness, Scotland.

—— I have read in GARDENING ILLUSTRATED the account of Roses, etc., at this time of year. I have six vases of the following Roses from the garden:—Marian Cran, Shot Silk, Frau Karl, Papa Gontier, and several old-fashioned Roses. I have also had Lavender and Mignonette. Marian Cran is well worth cultivating as she lives beautifully in water at this time of year, one blossom having lasted 10 days. A. WOOLSEY-BULLER.

Milestown, Castlebellingham,
Ireland.

Seaweed as manure

With reference to your correspondent's remarks as to Seaweed, there is no doubt that it is quite useful for the Brassica family, but I do not agree that it requires supplementing by kainit. Seaweed contains a good deal of potash and a great deal of salt, which are the important constituents of kainit. Moreover, I should never advise lime to be mixed with it. This would involve a loss of nitrogen. Apply the lime in advance. J. KNELLER.

Penrhyn Castle Gardens,
Bangor, N. Wales.

—— I notice Mr. J. S. Higgins finds Seaweed unsatisfactory in the garden. Can it be a different kind? We use it so much here; the difficulty is to get it. We have often mulched with it, and it has never had any smell. Usually the trouble is, it dries up. At Girvan, in Ayrshire, they consider the reason their early Potatoes are so good is that they use plenty of Seaweed. Could Mr. Higgins try a row or two of Potatoes with fresh Seaweed and see what happens?

Godstone. N. S. C.

A charming colour scheme

It is probably uncommon in many gardens to find the three following plants grouped together, but the effect is charming, *e.g.*, Rhododendron præcox, Erica carnea, and Cyclamen Coum.

All three make an unusually pretty combination of colour. The Rhododendron, with its rose-purple "butterfly" blooms, the little Cyclamen like a rich purple carpet underneath, and in the background the flesh-pink tint of Erica carnea make a pretty picture.

All three are hardy and easy to grow in any garden. They require no special soil or treatment, and can be obtained from most gardening firms. Frost, if very severe, may cut the blooms of Rhododendron præcox, but this does not happen in many winters.

The Cyclamen appreciate the slight shade of the little Rhododendron bushes, and if a few tubers are put in they will seed themselves and increase rapidly.

The Heath and Rhododendron can be planted from now on till early spring.

Near Bristol. A. C.

View from Glengarriff

Looking across to Ilnacullin from Glengarriff

Ilnacullin and its Gardens

The home of Mrs. Annan Bryce at Glengarriff, Co. Cork

If you sail to the nearest spot in Europe to America, namely, Castletown Bere, in the County Cork, and entering Bantry Bay, sail 20 miles up the Bay, due east, and then turn north, into what appears to be stern and forbidding mountains running up to not more than 2000 feet, you will find your way apparently blocked. But, if you are brave, and sail on, you will find a deep enough passage to take any sized vessel, and beyond the beautiful Bay of Glengarriff, wooded down to its shores, dotted with small rock islands. You will then see that what appeared to be a barrier to the entrance to this entrancing bay, is a large island, with a Martello tower on its summit, built by the English in 1815 as a protection to a possible invasion of the French under Napoleon. This fortress, in which there was a guard of one officer and 10 men, was abandoned as a fortress in 1825, and left to the sea birds and a flock of goats.

In 1910 it occurred to Mr. and Mrs. Annan Bryce to acquire this island of Ilnacullin from the British War Office, with a view to making gardens and building a house, and giving employment to the large and poor population living up the glens, the district being what is called "congested"—that is, the land is too poor to make a living off.

Before starting the work Mr. Harold Peto, the well-known architect and garden architect of the Italian Renaissance period, was called to advise.

He went up to the Martello tower, from whence it is possible to see most of the island, and, waving his magic wand, produced what is undoubtedly one of the most beautiful gardens of the world.

In the centre of the island arose a walled garden built in steps and strongly buttressed without, like an old Italian walled town; this is the kitchen garden, and is an acre and a rood in size; its gates, of which there are four, north, south, east, and west, are of very beautiful wrought iron, from Spain, of the 17th century.

Entering by the east gate and going out by the west gate, you come to a hard tennis court, completely screened from wind by an English Yew hedge, 15 feet high and 5 feet through. Beyond this is a smooth lawn of grass, capable of taking three tennis grounds and one croquet ground, with, to the north, beds of shrubs, containing Azaras Magnolias of many kinds, the beautiful Magnolia stellata, which comes out in very early spring before its leaves, like masses of Gardenia, followed by M. purpurea, Osaka, and Watsoni, large trees of Crinodendron Dependens, Acacias of all descriptions, the beautiful sweet smelling Skimmia Japonica, Raphiolepis indica, Embothrium coccineum, Andromedas of many kinds with their Lily of the Valley blooms, and many other (in this country) rare shrubs. The background of all these is a wood of various Pines, including the Monterey Pine, Douglas, Scotch (Pinus sylvestris), Cedars of Lebanon, also Cedrus atlantica and C. a. glauca. This wood acts as a protection against the north and north-west winds, as well as making a very beautiful background for the flowering shrubs.

South of the tennis grounds is another high bank, partly grass, but in parts planted with Heaths, Erica mediterranea, which here grows 8 feet high, Erica stricta, Erica carnea, the beautiful white E. codonoides, blossoming in January, and continuing for months with its waving branches, 2 feet long and more, and many others.

The west end of the tennis courts is closed right across by a very beautiful Italian tea house, used often as an annex for putting up guests. Mr. George Russell (Æ.) sometimes stays there, and turns it into a studio for his beautiful paintings.

This little gem of architecture is built of Bath stone; also all the pillars of its loggia, which extend for 57 feet to each side. They support solid beams of Teak, which have weathered the exact colour of the Bath stone. On the outside of the tea house are columns of "Rosso Antico," of which so much is seen in Rome. These columns were taken from the re-discovered quarry, and are of a beautiful red colour. Inside, the walls are panelled with slabs of marble from the Island of Scyros (a white marble thickly veined with a rich yellow). This is set in Carrara marble, of which there is also a dado, the floor of green Connemara marble done in Scaglila, the work of Italians brought over for the purpose.

As you walk through this tea house you see before you a sunk garden, surrounded on all sides by a hedge of English Yew, 15 feet high. This, besides being a magnificent background for the numerous rare shrubs and plants, makes a screen from all winds.

On the level of the tea house is a path, partly paved with flags of the local stone (Mica slate), and partly closely-mown grass, on one side the Yew hedge, on the other a hedge of Lavender, the real sweet Lavender of the old gardens, which was got from an old Irish garden. Going down five steps you come to the next level, the path of which is mown grass, with a deep bed full of rare Himalayan sweet-smelling Rhododendrons, Camellias, white, red, and some with flowers half white and half red, Polygala grandiflo that wonderful little shrub with its mau pea-like flowers, which is never out of bloo Leptospermum of various kinds, that beau ful shrub from New Zealand, which is 6-foot glory during May and June, Drim aromatica, and Drimys Winterii.

On the next and last level you come to broad flagged parterre, with another de bed containing more sweet-scented floweri shrubs, with various rock plants trailing o over the flags, low-growing Fuchsia, and between plants which vary according to t time of year, always a glory of colour. In t centre of this parterre is a Water Lily pon 15 feet by 30 feet, with an old lead copy of t winged Mercury of Giovanni da Bologna the centre springing from the water. Th Lily pond is lined with small blue-gre tiles to give the illusion of sea water, a round the edges in the water are pots rais on bricks of Iris Kæmpferi, tiny Bulrush and Reeds of various kinds. This Lily po contains myriads of goldfish, and in the ea morning the brilliant many-coloured kin fisher is to be seen darting over the pon occasionally, too, a melancholy heron m be seen standing on one foot gazing into t depths of the 3-foot pond, licking his lips, a heron is capable of such an action, over t goldfish, which are just out of his depth.

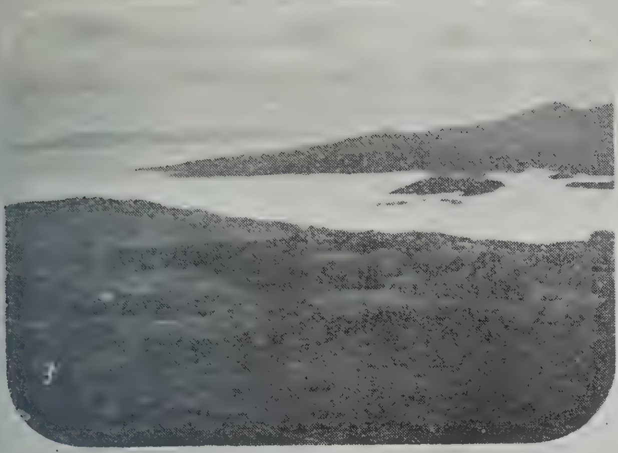
Round this pond are many tiny dwa Japanese Oaks, Maples, and Junipers, so of them 100 years old.

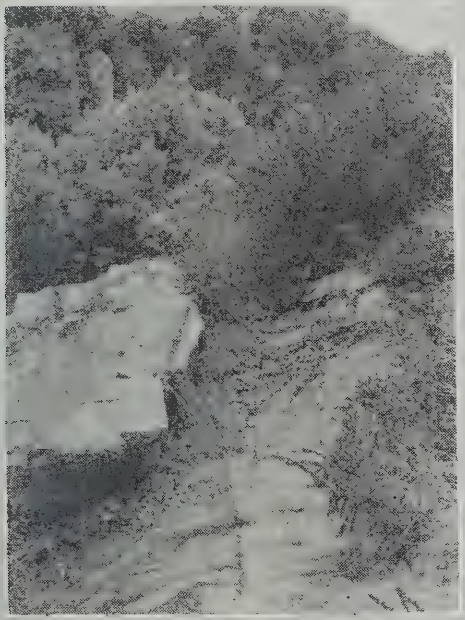
To the west the sunk garden is finished a beautiful Italian temple, with arches a open sides, the arches supported by pillars Rosso Antico, with white Carrara mar balustrading. Through the triptych form by the arches of this little house can be se the mountains of Slieve Ghoil Mor and Slie Ghoil Ben, with their rough glens of ro and Heather, and every here and there small dwelling, where often families of and 17 are reared.

The rest of this island of Ibera is plant with groups of Pines, and here and the plantations of Rhododendrons of all colou and shades, making a magnificent effect du ing May, June, July, and into early Augu while in other corners are beds of ma coloured Azaleas, with backgrounds of t great Pinus insignis or Monterey Pi Much of the island is left to its own w beauty of Heather, and patches of wild Gor with magnificent rocks peering up and ref ing to be hidden.

In some of the little coombs between roc are to be found the beautiful Epacris of A tralia, and many of the delicate Ericas South Africa, making in all an island never-to-be-forgotten beauty.

It was on this Island of Ilnacullin th Bernard Shaw got much of his inspiration writing "Joan of Arc," in 1924.





ILNACULLIN AND ITS GARDENS, THE ISLAND HOME OF MRS. ANNAN BRYCE, GLENGARRIFF, CO. CORK

1. Glengarriff, from Cob Dhu.
2. Bold clumps of Erica australis in full bloom.
3 & 5. A rocky way through the Heath garden.
4. Steep slope, where Pines and Heather grow in many species.
6. Step garden within the wall.
7. The loggia of the Italian garden house, columns of Rosso Antico.

Aster corymbosus

WHERE clumps of shrubs come close to the lawn there is usually a little space of ground either between the shrubs or just in front of them. Such places are not always treated to the best advantage; they are often merely filled up for the summer with any surplus bedding plants or half-hardy annuals. They have been more carefully considered in the garden where these notes are written. The picture shows one such space that has a quite satisfactory filling. A few groups, each of two or three plants of the large form of Megasea cordifolia, are interplanted with the pretty little Aster corymbosus, neat and short, with quantities of the whitish bloom gracefully carried on stalks that look like fine dark wire. The large leathery leaves of the Megasea are a becoming setting to the little starry Aster, and both plants seem to gain by their extreme diversity of form and habit.

G. J.

Aster corymbosus, with Megasea cordifolia major

Propagate Carnations

Select sturdy but not unduly stout side shoots and insert firmly round the edges of small pots filled with very sandy compost. If a little bottom heat can be given so much the better, but really strong heat will lead to failure.

Gladioli of 1928

SO far as my garden was concerned the year 1928 produced more disappointments than surprises. Of the new stocks of some of the older varieties the Primulinus Asia and Tea Rose were marked for "discard"; those of Bronze Queen and L'Anthie were mixed; Bernard Kuhn, Dr. Karl Ochs, Mrs. F. C. Hornberger, Walter Bloom, Appleblossom Pontiac, Miss Madison, Halycon, Hopewell White, London Smoke, Temblor, Mrs. J. K. Armsby, Margaret Glendenning, Wedgewood, Chateau Margot, Susanne Worden, Garden Beauty, and the whole of the varieties I obtained from Australia were failures—some total and others in a lesser degree. For instance, of Temblor only one bloomed out of 25; Dr. Karl Ochs and Bernard Kuhn only four each out of 12; Walter Bloom two out of 12; Ella Kelway eight out of 12. On the other hand, Rose Ash, Mrs. Leon Douglas, Beatrice, Dr. van Fleet, Aristotle, Liberty, Fastidious, Lexington, Leen Wone, and Golden Measure, among others, did well. This year I steeped all bulbs before planting, using a 10 per cent. solution of Formalin. I cannot say that it had much effect.

ARABIA (20.8) struck me as one of the darkest Gladioli I had ever seen. The buds, like some others, appear perfectly black, but, unlike those, open out with the same depth of colour. Seeing how often one has been disappointed with the unclosing of dark buds of many in the past, it was a surprise to find that the dark colour held as the flower gradually developed.

ALGONQUIN (4.9), named after one of the Indian tribes still existing in the Province of Quebec, did not appear to me to be anything out of the ordinary run of seedlings.

ALMA (26.8) had a spike of 20 pips with eight flowers open. The colour is a good pink. A strong grower.

BRIDAL VEIL (15.8) may be added to the list of good whites.

BLUE TORCH (9.8), a welcome addition to the blue class.

CAMPANELLE (18.8), a Primulinus grandiflorus, salmon with yellow throat.

DELIGHTFUL (24.7), a very pleasing flower with five out on a spike of 15 pips. The colour is deep salmon with a yellow spot. Very appropriately named.

DOROTHY VAUGHAN (28.8), a rather thin apple-blossom pink.

EDITH MASON (30.8), another pink with a cream centre. A strong grower with a spike carrying 21 pips with five open flowers.

ELFIN (9.8), a very free-flowering Primulinus. The general tone is saffron-pink melting away to maize-yellow in the throat with delicate feather of nopal red. A tal spike with 16 pips.

ELSIE McCORMICK (22.8), a rose-pink with dark blotch. The flowers are rather crowded and somewhat irregular.

FOREST SPRITE (10.8), a bold flower, striking in appearance. A good spike with scarlet flowers edged with white.

GOLDEN AMBER (8.9), a deep yellow Primulinus grandiflorus, the back of the petals being bronze.

FIMBRIATUS.—As the bulbs of this variety were planted very late the date of flowering would be misleading. A lacinated variety yellow in colour, of remarkable form and habit.

GOLDEN VICTOR (7.9) was also very late planted, but should, under normal conditions prove worthy of its name.

GOLDEN DREAM (Groff) (26.8) proved a disappointment. Can hardly believe it came true.

HELEN WILLS (16.8) is not new, but worthy of mention, as it produced the finest white spikes in my garden.

HELEN HOWARD (12.8).—Not a tall grower the spike carrying only 13 pips, but is a pleasing colour, buff flushed coral.

IMPROVED SCHWABEN (27.8), quite distinc from the old variety, being deeper in colour and the blotch on the lower petals is a dul purple. The flowers are also larger and wel placed on the spike. A strong grower.

IMPROVED MARTHA WASHINGTON (28.8) taller and deeper in colour than the origina Martha.

KUNDERD'S YELLOW FAVOURITE (12.8), and one of mine also (see illustration).

LEXINGTON (28.8), a good free-flowering scarlet.

LAVENDER BEAUTY (11.8), one of the lacinated varieties, but must be well grown to please. Twenty-two pips on a 4-foo spike.

LILIOLA, a wide, open flower, mostly a right angles to the spike, yet a good flower for the border, not too tall. The top flowers open before the lower ones become untidy the whole being borne on sturdy stalks. The whole effect reminded me of the beds of purple and white Petunias of 50 years ago.

LOYALTY (12.8), a deep, rich, pure yellow of medium height.

Kunderd's Yellow Favourite

Improved Schwaben

Mme. Herriot (23.7), a good orange Primulinus.

Martha Phillips (1.9).—This did not appear to be a strong grower, notwithstanding that it produced some good spikes of dark red flowers in rather close formation.

Manistee (17.9), a late ruffled pink.

Mary H. Dick (12.8), a Primulinus grandiflorus variety producing a clear, well-flowered spike of pink blooms with yellow centre. Eighteen pips with six or more open at one time.

Midnight (15.8), a medium spike with flowers suggestive of its name.

Milady Imogen (14.8), a very pleasing pure white, quite one of the best. Many open and remaining good for many days in the open.

Mrs. Julius Rosenwald (22.8) produces a spike with 14 pips well placed on a slender stem. The colour is wine-red.

Mrs. L. S. Hubbard (15.8), a plum-coloured Primulinus grandiflorus which should prove a welcome addition to this section. Unfortunately, the bulbs in this colour section are not, as a rule, of very robust constitution.

Nellie Grant (14.8), a red-purple, a colour not much in demand.

Orange Butterfly (2.9), a Californian Primulinus of great promise.

Patricia Carter (12.8).—This is a much-praised lady, and one expected much. Well, we were not carried away at first sight, but, nevertheless, she is a beauty.

Piccadilly (26.8), almost a white, free-flowering, and of medium height. Lasts well.

Queen Esther (28.8), described as "a brilliant purple and gold Gladiolus," proved a poor grower.

Princess Elizabeth (12.8) proved outstanding in many ways—in form, colour (clear pink), and growth.

Radiant (5.9), a strawberry-pink Primulinus with 11 pips.

Radiant Orange (22.8), another good Primulinus grandiflorus.

Riding Hood (10.8), a bright red Primulinus.

Sandusky (11.8), not a large flower of the fancy type. I should think it has some J. T. Pirie blood in its composition.

Sir Thomas Lipton (1.8).—To those who like them tall this one should be welcome. It is pink in colour and you do not have to stoop to see the flower.

Tiger (27.8) will appeal to those looking for a good fancy.

Tobersun (3.9), so named because it flowered, where raised, in the month of October. A very good yellow of more pronounced form than Golden Swallow.

Verdun (29.8) is one of the purple pansy-coloured varieties of which there are a good many named and on the market, few of which, however, are worth growing. This one seems likely to prove the exception.

White Pendleton (29.8).—Introduced in 1917, it is some years since I first saw this flower, and its blooms of white with a dark purple blotch were good to the eye.

Zona (31.7), another of the small round Primulinus type. The colour is a deep salmon-rose.

Primrose Princess (17.8).—This is a fine flower. One bulb produced a main spike which was cut just above the first of the three side shoots.

Should any reader wish to grow flowers of more than average height there are two varieties which are taller than any I have previously planted. One is Mary O'Mine, a rather coarse white, which is well over 5 feet, and the other is Gallant Leader, a pink which, I think, is even taller. You could easily be lost to view in a bed of either. Smilax.

Centropogon Lucyanus

This fine greenhouse perennial is no new plant. It was raised by M. Despard, of Marseilles, in 1856, by the crossing of C. fastuosus and Siphocampylos betulæfolius. It belongs to the natural order, Campanulaceæ.

It is a very pretty carmine-pink in colour. The flowers are tubular and are produced freely at the end of short lateral spurs. C. lucyanus makes a capital plant for basket culture, owing to its semi-procumbent habit, which shows off its beauties to advantage. When grown in pots, however, this plant requires staking, short green stakes being used so as to be as inconspicuous as possible.

Flowering as it does in the dead of winter it is altogether a useful and delightful addition to any conservatory.

Propagation is effected by means of cuttings. Young shoots 3 inches or 4 inches in length make ideal plants after striking in sharp sand and loam.

The soil should be made as porous as possible to counteract the tendency of it becoming sour.

Some very fine specimens may be obtained by cutting back old plants and repotting into larger size pots.

Young plants struck in spring and flowered in 6-inch pots will suffice for all general purposes. F. H. Wright.

University Botanic Gardens,
Cambridge.

New Paths for Old

A Colas drive at Lilford, near Peterborough

THE increase of modern traffic has undoubtedly revolutionised the methods of road construction and maintenance during the past few years. Nor is this revolution in constructional methods confined to the public highways, for the problem is almost as acute on estates where heavy lorries and fast-moving cars play havoc with the ordinary gravel drive surface.

When the necessity for binding the loose gravel surface was first felt the estate owner was confronted with many difficulties. The only course open at that time was to apply a protective coat of bitumen or tar heated to a high temperature, but not only was this operation a dangerous one unless carried out under expert supervision, the results were not always satisfactory. Furthermore, an essential condition for the application of hot bitumen or tar is a perfectly dry surface, and as estate labour was hardly suitable for such work it is, therefore, not surprising that the more costly course of periodical regravelling was pursued in nine cases out of ten. A further objection to this method was the unpleasant black surface provided, which softened and bled readily during hot weather and which was dangerous to all forms of traffic, both horse and motor, when the surface was damp.

Modern science has evolved binding materials which can be put down by unskilled estate labour at any time of the year and which produce a really satisfactory surface capable of standing up to the heaviest traffic without requiring the usual constant attention demanded by the ordinary gravel drive.

Colas is a British product manufactured by Colas Products, Ltd., 38-39, Parliament Street, London, S.W. 1, and is pure bitumen in cold fluid form. It arrives ready to apply in sturdy steel containers, or, alternatively, it can be delivered and applied under pressure by 1,000-gallon tank lorries. Colas provides a clean, hard surface which affords plenty of grip in all weathers for all kinds of traffic. The results are durable, and the treated surface harmonises perfectly with the surroundings—the colour is determined by the colour of the stone chippings, shingle, or fine gravel with which the dressing is covered. This material is becoming increasingly popular on estates large and small throughout the country for modernising drives and paths without spoiling their appearance. The illustration shows a Colas drive at Lilford, one of the most beautiful estates in the country. In preparing these drives it was of the utmost importance that both drives and paths should harmonise perfectly with the surroundings, and this has been effectively carried out.

Another new process for making an excellent adamant surface, which obviates mud, weeding, rolling, and scouring under stormwater has been devised by a firm of paving experts of many years standing, Chittenden and Simmons, Ltd., Bank Buildings, Maidstone, which they appropriately name "Gravelite." This secures the durable, cleanly, and labour-saving qualities of tar-macadam combined with the general colour effect of gravel. This process has proved very satisfactory after an exhaustive period of test. The manufacturers offer to go carefully into the requirements of any interested inquirer and quote for the material supplied and laid complete.

"Cold Chon" is a pure bitumen emulsion made by the well-known firm of manufacturing chemists and tar distillers, Richard Smith's Executors, Ltd., 182, West Street Glasgow, which, when poured on the road or path, soon hardens and holds tightly the gravel, chips, or cinders spread on it. This preparation binds the gravel into a solid conglomerate and makes it impossible for the surface to be broken by floods. Although setting very hard, it produces a resilient and durable surface where weeds have no possible chance of taking root. In calculating the quantity required the condition of the surface must be taken into account. If it is very rough, with many ruts and potholes to fill in, 1 gallon to 12 superficial yards would be required. If an ordinary avenue surface is to be covered 1 gallon to 2 square yards and if the surface is very good 1 gallon wil be sufficient for 3 square yards. Although Cold Chon has a bitumen base the colour of the path is that of the gravel used on the top.

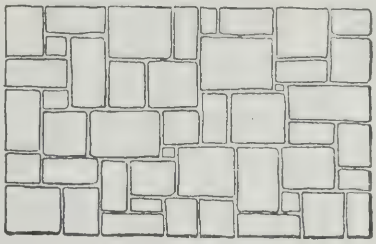
An entirely different path to the above is the "Noelite," consisting of tiles made in various sizes and in six different colours and shades. The surface of each tile is covered by means of a patented process with minute corrugations which prevent slipping in wet weather. Severe tests have shown Noelite to be free from all risk of damage by fro t. This paving is supplied by the square yard, which is more advantageous than by the ton. The paths on which the tiles are to be laid are first made perfectly smooth and wel rolled. A thin layer (½ inch) of sifted soil or sand is then spread on the surface and the tiles laid in position one by one and firmly pressed down. The best effect is obtained by leaving a space of about ½ inch or ¼ inch between each; soil or sifted sand is then thrown over the surface and well brushed into the spaces. At the end of two or three weeks no movement will take place in the tiles and the path will need no further attention. Fuller particulars of "Noelite" are obtainable from Noel Thomas, Borough Green, Kent.

A broad path being treated with "Cold Chon" (tree shadow in foreground)

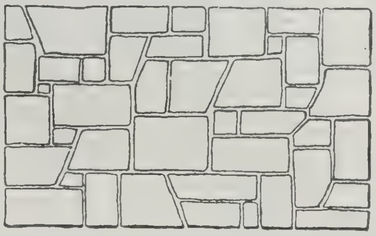
There is, perhaps, nothing to equal both for effect and durability good solid squares of

"Noelite" terrace in brick red

METHOD WITH CRAZY PAVING



Random squares



Random squares and pieces

ork paving. Crazy has still an enormous ogue, and when used with restraint and ith an eye to fitness of the site it certainly as much charm. Too often one sees it used discriminately and with pernickety re-ilts. This latter can be avoided if it is well id and two solutions of this problem are own in the illustrations kindly lent by Rhymney Quarries, 76, Chancery Lane, W.C. 2—Random squares (Fig. 1) and Random squares and pieces (Fig. 2). These while more expensive than ordinary crazy, are recommended when a more formal effect is required, as in terraces and loggias.

Crazy paving can be laid without a great deal of preparation by almost any amateur and to almost any path that is fairly level. From ¾ inch to 1 inch space should be left between the flags to allow rock plants, grass, or Moss to be cultivated, and if, after the paving is laid, road sweepings be swept between the joints, the appearance will be greatly enhanced as these sweepings contain sand, manure, and seeds.

HERBACEOUS BORDERS

TO-DAY we have at our disposal a wealth of splendid hardy-plants and an infinite variety of form and colour to suit every quirement. There are plants for sun or iade, for forming colour schemes, for argins of streams, for open woodland ades, and every part and purpose in the irden.

Also if the right kinds of hardy plants are iosen we may have a succession of flowers actically the year through, from the early rocuses and bulbous Irises in sheltered spots January to the Christmas Roses in ecember.

The vast improvement that has been made hardy plants during the last 20 years, pecially in such genera as Delphiniums, upins, Carnations, Irises, Antirrhinums, quilegias, Poppies, Pæonies, etc., has pro-ded the garden lover with enough material produce an ideal picture of beauty in the irden.

As to the borders themselves, there are veral types in present-day gardens. First all we will take the one very frequently et with, the straight border at the base of wall. Such a border I should recommend be not less than 7 feet to 10 feet wide, in der to make the fullest use of tall, medium, id dwarf hardy plants. The wall, of course, ust be clothed with suitable climbers, hich may consist of Roses, Honeysuckles, lematises, etc. We shall then not only get good background to the plants in the order, but it will break up the flat surface the wall.

With regard to the front of the border, the st effect is obtained to extend the lawn to s margin, but where it is necessary for a avel path there should be a margin of turf out 18 inches wide between the border and ith.

On no account use tiles as some do. If an lging has to be made arrange pieces of rock quite in an informal way and the interstices planted with trailing Alpines, such as Sedums, Saxifrages, Arenarias, Veronicas, Helianthemums, and many others. There will then be a delightful living fringe to the border.

Then there is that fine type of border frequently met with in large gardens. Really there are two borders with a broad grass path between forming a glorious vista and feast of colour. It is not only a natural way, but an artistic one, of making borders for hardy plants. No one can deny that the broad green path adds greatly to the beauty of the flowers and is far more pleasant to walk on than a hard surface. Such borders I would terminate with simple archways of Honeysuckle and Clematis Jackmanii. But a similar idea might even be carried out in the small garden. If the garden runs north and south make wide borders on the west and east sides, and the centre entirely occupied with grass. This would give a far more beautiful effect than the usual grass plot and patchy little beds.

Undoubtedly, grass is the best foil or setting for a good herbaceous border. I have seen a wide crazy path between the borders with Alpines in the crevices here and there, and although I must confess it was effective, there was an air of formality about it.

Frequently in gardens of some size there is a choice collection of flowering and ornamental shrubs, and here it is we have another effective style of perennial border. Of course, I am assuming that the shrubs have been planted to form irregular bays jutting out here and there, and not in a formal straight line.

Here, then, hardy plants will associate themselves well with the shrubs, producing a glorious effect. The shrubs in question are the choice sorts, not the vigorous common shrubs whose roots penetrate the soil all over and would rob the plants of food and moisture.

Where a large supply of cut flowers is required herbaceous borders are often made in the kitchen garden. These vary from 4 feet to 8 feet in width, with a background, perhaps, of espalier fruit trees. These borders are generally planted with such useful things as Campanulas, Lupins, Delphiniums, Ox-eyed Daisies, Gypsophila paniculata, Michaelmas Daisies, Pyrethrums, Phlox, Pinks, and annuals like Asters, Sweet Peas in groups, Scabious, and many others.

Borders formed in front of such things as Holly, Laurels, or Box the perennials never thrive for long, owing to the poorness of the soil, due to the roots of the shrubs. It is also unwise to grow hardy plants in front of walls covered with strong-growing Ivy for the same reason.

To make all borders a success and to grow the hardy plants really well the ground must be deeply dug and well enriched, as the plants have to occupy the same position for some years.

F. H.

INDOOR PLANTS

Winter flowering Begonias

Taking cuttings

FOR winter decoration these profuse-flowering plants are very useful and their value cannot by any means be over-estimated. Most of them make remarkably handsome, bushy plants, covering themselves with their brilliant flowers when most other things are at rest, while the long duration of the flowers renders them almost indispensable. Since the first variety came out there has been considerable improvement both in form of flower and constitution.

The first variety, raised by Mr. J. Heal, made quite a stir in the horticultural world, and was greatly admired. This was followed by Mrs. J. Heal, Julius, Winter Cheer, Success, and Ensign. Since then, however, many other beautiful varieties have been introduced. There is only one fault with these Begonias, some of the varieties, such as Gloire de Lorraine, are liable to almost flower themselves to death, making it very difficult to obtain cuttings for propagation. It is simply a useless operation to insert cuttings with flower-buds on them, for these in a very short time expand and thoroughly exhaust the cuttings. Some system must, therefore, be adopted to stop the plants flowering in order to induce suitable young shoots to spring up from the base that can be used for the purpose of propagation.

To obtain these cuttings the first thing is to reduce the water supply to a few old plants that have flowered for some time during the winter months and place them on a shelf in full sun in the greenhouse to afford them a few weeks' rest. At the end of this time cut off the plants close to the rims of the pots and take care to keep the soil on the dry side. Careful watching will now be required, and directly it is seen that young shoots are pushing up give a little more water and stand the pots in a warmer part of the structure.

When these succulent young shoots attain the length of 2 inches they should be removed and inserted in well-drained pots filled with a compost of one part loam, one part leaf-mould, half a part peat, and half a part of silver sand. A little pure sand should be placed on top, as then the dibber will carry a little down for the base of the cutting to rest upon.

A gentle watering with tepid water through a fine-rosed can should be given after the cuttings are inserted, and allow the pots time to drain. Plunge them then in a gentle bottom heat, but this is not absolutely necessary, for I have rooted them freely when stood over the hot-water pipes, taking care they never become dry.

No matter which plan is adopted, it is most essential to shade them from all sunshine, for if this is once neglected there is great danger of the whole batch being spoilt.

When the cuttings are well rooted pot off each singly in 3-inch pots, using a similar compost to that used for the cuttings, taking care to press the soil moderately firm about their roots.

When the operation of potting is completed place the whole batch in a warm, moist atmosphere and give them a slight syringing over two or three times a day, which will prevent them flagging and also encourage quick root-action.

As these pots become well filled with roots —which will be in six or seven weeks—they must be shifted into 5-inch or 6-inch pots, in which they should flower. The compost for this final shift should consist of equal parts of good loam and leaf-mould with a third part each of well-decayed cow manure and sand, mixing the whole well together and used in rather a coarse condition. About a fortnight before this final potting the plants should be pinched to induce a bushy growth. From the beginning of June till the end of September the best place for the plants is a cold frame.

When the time for housing the plants arrives they should first of all be removed to a cool greenhouse and afterwards transferred to a warm house to flower. As with most plants newly potted, watering must be carefully done; afterwards, when well established, liberal supplies will be required during the growing period, and a syringing morning and evening in bright weather will be conducive to vigorous growth.

One of the most important details in the cultivation of these Begonias is to see they are shaded in warm weather during the growing season, for if this is neglected the foliage suffers, presenting a yellow and unhealthy appearance instead of a beautiful healthy green colour.

If cuttings were rooted about April and treated as advised the plants should come into flower some time in October and continue without a break until April.

A little liquid-manure will be required by the plants during this period, say, once or twice a week.

A liquid I find good for these Begonias can be made by placing half a bushel of horse manure and half a peck of soot in a coarse canvas bag and immerse it in a tub of 40 gallons or 50 gallons of rain-water. Before applying to the plants dilute it until it is of the colour of pale ale.

During the growing period a temperature between 65 degs. and 70 degs. should be maintained, with a liberal amount of moisture in the atmosphere, which can be obtained by damping down the walls and stages of the structure.

If given good cultivation they are not much troubled with insect pests. Green Fly is the worst enemy, but this can soon be got rid of by vaporising with nicotine. F. H.

VEGETABLES

Broccoli in winter

WHILE there is little difficulty in maintaining a supply of Cauliflowers during the summer and autumn months, the regular supply of their counterpart, the Broccolis, during the winter and spring months depends to a large extent on a well-organised system of cultivation. Much as the Cauliflowers are appreciated during their season, the Broccolis are even more highly appreciated during the winter and early spring months because there are fewer varieties of other succulent vegetables available for furnishing the needs of the kitchen. Further, it may be said that our modern varieties of Broccoli are in appearance, flavour, and food value quite equal to the finest Cauliflowers, and that by a careful selection of varieties and a good system of cultivation, unbroken supplies may be maintained, provided that climatic conditions are not of unusual severity.

The hardiness of Broccolis is sometimes challenged, and one must admit that it is not absolute, but hardiness is a relative term, and it is within the power of the grower to fortify the plant to resist inclement weather conditions by studying and supplying its needs. It is undoubtedly true that large areas of Broccoli succumb to spells of severe frost even in relatively sheltered gardens, but this is often not so much due to the severity of the weather as to the fact that insufficient consideration has been given to the selection and preparation of the site on which they are grown, and this applies particularly to those varieties which are intended to stand the winter and produce supplies during the spring months. While the Broccoli is a moisture-loving plant, anything approaching stagnation is inimical to its welfare, hence the first consideration in its successful cultivation is well-drained land. An open situation should also be selected where the plants get full exposure to light and air, and sufficiently wide planting should be practised to allow a free circulation through the bed, promoting sturdy and well-ripened growth. The soil should be firm and not too rich, and it is good practice to prepare the ground some time before planting to allow of thorough consolidation, or they may even be planted in ground recently occupied by other crops without further preparation, if such ground has been liberally treated.

Seed is usually sown in April and May, an care should be taken that the plants do nc become weakened through overcrowding ur til they are ready for their final planting i June. Some growers sow thinly and neve transplant previous to the final planting, an if ample room is given in the seed-bed goo results may be obtained by this method, bu transplanting ensures stronger plants. Th rows should be at least from 2½ feet to 3 fe apart, and after planting the soil should b kept constantly stirred to promote health growth.

Plants grown under the conditions her described generally withstand all but th severest weather, but if long spells of fros occur when the heads have almost develope they may suffer, and the practice of layerin the plants so as to face north and preven the sun from getting to the hearts, form some measure of protection. The actua freezing does little damage, but alternat frost and thaw caused by the sun thawin the hearts by day is destructive. Batches ma also be lifted with a fair amount of so attached and placed in a light, well-ventilate shed, where they will keep good for a cor siderable length of time and maintain sup plies. They soon deteriorate, however, i stored without the roots being surrounde with moist soil, and once the heads are cu they should be used immediately.

There is an ample number of good varie ties to enable the grower to provide for regular supply from late autumn till lat spring. Michaelmas White, Veitch's Sel Protecting and Walcheren yield heads durin November and December. For January an February supplies there are several goo types of Winter White, all of which hav well-protected heads. A selected stock c Penzance or Cornish White, which is so ex tensively grown in Cornwall, is also an ex cellent and esteemed variety. For use i March and April that old favourite, Knight' Protecting and Leamington, a variety of hig quality, may be relied on; while Late Queer Model, and Latest of All carry the supplie on through May, and in late seasons we into June.

The most serious disease in the cultivation c the Broccoli is that of Finger and Toe, whic attacks the various Brassicas, and is ver destructive. In some soils it has become ir creasingly difficult to grow this crop becaus of the virulence of the disease, and it is to b feared that in some cases conditions hav been aggravated by the injudicious use of aci manures. The most effective preventative i lime, and it is noticeable that the disease i almost unknown on calcareous soils. Th use of ground limestone is effective, but nc so quick in action or powerful as burned lime which is slaked before spreading. It is als a manifest advantage in the control of th disease to practice rotation of crops, but a so many Crucifers act as hosts to the diseas this is sometimes difficult, and the goo effects of the practice are frequently mini mised by the growth of cruciferous weeds.

W. AUTON.

Horticultural Examinations, 1929

Candidates for the examinations of th Royal Horticultural Society are reminde that the closing dates for entries for th 1929 examinations are as follows:— General Examination (Seniors and Juniors) January 14th, 1929; Teachers' Examinatio (Preliminary and Advanced), January 14th 1929; National Diploma in Horticultur (Preliminary and Final), February 1st, 1929 Scholarship Examination, March 30th, 1929 Entry forms and full particulars may b obtained from The Secretary, Royal Horti cultural Society, Vincent Square, London S.W. 1.

REMINDERS FOR THE WEEK

Mr. E. Markham, the writer of the Calendar for Southern and Midland Gardens

For nearly 17 years Mr. Markham has been head gardener to William Robinson, the founder of "Gardening Illustrated," at Gravetye Manor, East Grinstead

Southern and Midland

A Retrospect

In many respects the year 1928 has been a very fine one in this district. Fruit has been plentiful and of fair quality. If, in the case of Apples it was a little on the small side, we have every reason to be satisfied, and in the case of Pears and other fruits more than satisfied. Vegetables, too, were never better than during the year now gone. The New Year is almost like the arrival of spring to the keen gardener, who at once looks forward to the arrival of more sunshine and light, the effect of which is quickly noticeable upon plant life, under glass especially, and if not at once so apparent among the open-air subjects it is, nevertheless, unmistakable to a keen observer.

The seed list

Without this important annual we could not, I fear, record much progress, but our seedsmen never fail in placing their carefully arranged lists before us, and here I would add that the humble catalogue of seeds should be examined with the same care as those of more imposing dimensions, for it is by no means unusual to find in one of the former some old or new favourite which, for various reasons, has been omitted from the latter. Therefore peruse seed lists with care, bearing in mind the successes and failures of the past year, and where the latter have occurred endeavour to replace with a different variety of seed, even if it entails the risk of a novelty. Whenever possible the order sheet provided by the seedsmen should be used. It is equally important that orders should be early to avoid disappointment.

Plants in frames

During frosty spells these are sometimes, of necessity, kept covered up for days together, and for this reason every care should be taken during favourable weather to admit air freely and remove every particle of damping leaves, otherwise this will spread rapidly and ruin quite a number of plants. This applies particularly to autumn-struck cuttings, which are, of necessity, planted close together.

Plant houses

Light is of the greatest importance at this early date, and in order to admit of its full penetration to the plants all glass should be washed thoroughly, also all woodwork, with strong soapy water to which has been added a little paraffin emulsion. Gravel clothing the stages should also be cleansed by the use of a sieve and low tub of water before being replaced; and after this the plants themselves, so far as possible, and green pots should be scrubbed.

Climbing plants

These must be taken down, pruned, and in some instances sponged with a good general insecticide before being replaced. A little of the surface of their soil should be taken off and fresh, sweet material added.

Vines

The earliest house will, ere this, have been cleansed and prepared in readiness for starting, and succession houses must be taken in hand at the earliest opportunity. Any remaining bunches of late kinds may be cut and placed in bottles in the Grape or store room, where they will keep as well, or even better, than they would in the house. The work of pruning, cleaning of house and Vine, top-dressing of borders, etc., may then be proceeded with.

Fruit trees

Whenever the atmospheric conditions permit, the pruning of Apples and Pears must be carried on. The ties of trees trained to walls should be carefully examined at the same time and renewed where necessary, as nothing is more aggravating than to find a branch or cordon when laden with fully developed fruit broken down and damaged beyond repair owing to this neglect.

Flowering shrubs

Thinning and pruning of most of these may be taken in hand with considerable advantage to the shrubs themselves. The beauty of carefully thinned and balanced specimens is vastly superior to the congested examples we too often see. Not only are such more elegant in appearance, but the quality of their flowers is superior in every way.

Kitchen garden

Protect Celery and Celeriac with light litter during frosty weather. Lift a few roots of the latter, Salsafy, Scorzonera, Parsnips, and Artichokes, and place in a cool store for use when atmospheric conditions render lifting difficult. Wheel manure upon plots during frosty weather and spread it as a protection to the surface. This will facilitate digging operations. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

MR. CHARLES BLAIR,
Preston House Gardens, Linlithgow, the 1929 writer of our Calendar for Scottish Gardens.

New Year Greetings

I should like to offer to all readers of these notes the heartiest good wishes for the New Year. While 1928 gave us by no means a good gardening season here in the north, still, on the whole, it was much better than its immediate predecessor, and we will hope that 1929 may again be an advance, and that good crops may reward us for all the care and labour we devote to the cultivation of the soil.

Rhubarb and Seakale

Continue to introduce fresh roots into heat according to requirements. As the season advances growth is much more easily excited, so it will be necessary to see to this more frequently than formerly. It is also a good plan to cover a few stools of Rhubarb in the open garden with barrels, boxes, or proper cans, surrounding these with a generous amount of leaves, or leaves and long stable litter should such be obtainable. Movable lids should be fitted to each barrel, box, or can, so as to provide easy access at any time. Seakale may be forced in the same way, the resulting heads, as a rule, being finer than from lifted roots.

Planting Horseradish

Where there is a steady demand for this root it is necessary at times to lay down a fresh bed, and the present time, providing the weather be open, is very favourable for carrying this out. The site should be deeply trenched and a fair dressing of well-rotted manure worked into the lower spit. If it is likely that the new bed will be required to provide supplies in autumn, then good strong roots having each a crown attached must be used, whereas when the bed can be left undisturbed for at least a year then pieces of root 4 inches to 5 inches long and as thick as a man's forefinger should be taken, and these planted about a foot below the surface.

Manuring and digging

With so much damp weather during autumn and early winter this work in many gardens is considerably in arrears, so every favourable opportunity must be seized to push forward such, for the earlier the ground can be turned up to the elements the sweeter and more kindly it will be in the coming spring. Trenching and double-digging should also receive early attention when the soil is in a workable condition.

Bulbs in pots

Later batches of these should be dug out of the "plunge" and set for a week or 10 days in a cold frame before placing them in warmth. Very gentle heat should be given, especially at first. Those coming into flower will last much longer and be of finer colour if kept in a greenhouse or pit from which frost is merely excluded.

Chrysanthemum cuttings

The bulk of the single-flowered and decorative varieties succeed well if cuttings be secured about this time. While roots are formed more quickly when warmth is applied to these cuttings this is discounted later, the resulting plants being weaker and lankier than are those rooted under cool conditions. Frost must, of course, be excluded at all times, but no more heat should be given than is necessary to ensure this.

The seed order

This important duty should be attended to at an early date as numerous items require to be sown almost at once, and in any case it is so much more comfortable to have the year's supplies at hand so that no suitable opportunity is missed to get these consigned to the soil at the proper time. Early ordering is also advantageous by ensuring that everything required can be supplied, whereas the late-comer is often faced with the words "sold out, so and so sent as substitute."

Earliest seeds to sow

To ensure the resulting plants blooming the first year it is desirable to sow the seeds of Begonia, Gloxinia, Streptocarpus, Pentstemon, Hollyhock, and Pelargonium during the next 10 days or so. The first three demand a moist temperature of 70 degs. to 75 degs., the others doing nicely with 10 degs. less.

Tomatoes

To have ripe fruits about the end of May seed should be sown at once and placed in a temperature approximating 70 degs. Under favourable conditions growth will appear in about a week's time, and, as soon as it does, have the pots or pans raised up close to the roof-glass or the little seedlings will "draw" badly.

Leeks and Onions

Where large samples of these are desired seeds should be sown now, using boxes of rich compost set in a temperature of not less than 60 degs. Cranston's Excelsior and Ailsa Craig are probably the best varieties of Onion for present sowing, while Pitt's Monarch and The Lyon are both very fine Leeks.

C. BLAIR.

Preston House Gardens, Linlithgow.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

CHRYSANTHEMUMS

Fixing a Chrysanthemum sport

I have a lovely sport on a Chrysanthemum plant, Blanch Poitevene. It is a splendid deep incurved flower, and I am anxious to get all the plants I possibly can from this sport. Will you, please, inform me through your valuable paper how best to get the cuttings?

WM. H. ASTBURY.

[The best method of fixing a sport and obtaining a fair number of plants of the variety is as follows:—When only one branch of the original plant has sported all other branches should be carefully cut away; then the dead bloom of the sport should be removed, but all the leaves should be left on the branch. Now turn the plant out of its pot and lay it on its side in a greenhouse or frame; if the structure is slightly heated so much the better. Cover the root system and branch with Cocoanut fibre and arrange the plant so that the buds in the axils of the leaves are just buried and the greater portion of each leaf is above the fibre. This treatment induces each bud to grow out into a shoot, and when these are long enough they should be taken off as cuttings and struck in the usual way. Plants obtained by the above means, taken from the actual shoot that has produced the sport, should reproduce the desired flower. Any cuttings that arise from the base of the sported plant should be struck. Some of them may produce flowers of the sport you wish to perpetuate.]

ROSES

Rose on wall

(Feathers).—From your description of the site on which your Rose is growing it does not appear to be an ideal one. The actual cause of the marked foliage is not, however, due to site, but to the attack of an insect, viz., the Rose Leaf-Hopper (Typhlocyba rosæ). If you examine the foliage on the underside you will find one or more dried insect skins. These are the cast skins of the creatures concerned. The life-history of the Rose Leaf-Hopper is as follows:—The adults appear in May and are pale yellow in colour, and their length about one-sixth of an inch. When disturbed they take flying leaps into the air by means of a long pair of hind legs. Females place their eggs just under the skin of the leaf. In due course these eggs hatch and the young larvæ fix themselves to the leaf by means of their proboscis and feed on the leaf sap. Later they get too large for the skin, and this then splits and the active pupal stage emerges,
and from these the adults develop some tin
in September, and egg-laying commenc
again. Winter is passed in the larval, pupa
and adult stages. The best control you ca
adopt at this period is to give the tree
thorough spraying with a good nicotine wa
and then pick off all the leaves and bu
them. Watch carefully for the appearance
the pest in the spring and use your spr
fluid as often as is necessary to obta
control.

FLOWER GARDEN

Trouble with Gladiolus

In cleaning up my bulbs this year I ha
found quite a number affected with sca
What is it? The bulbs were planted
ground which had never grown Gladiolus b
fore, so my surprise was great, more pa
ticularly as from ground which had h
Gladiolus planted in it two years ago I lift

GREENHOUSE

Begonias as house plants

The article by Mr. H. Greaves (iss
November 17th), entitled "Begonias
House Plants," is interesting. I ha
specialised in Begonias for nearly 20 yea
and find no difficulty whatever in growi
them to perfection under glass or in the op
border. My experience, however, has be
that the tuberous Begonia is the least ada
able of all plants for growing in rooms.
therefore came somewhat as a shock to n
to read that Begonias make "very satisfa
tory plants for indoor use." On readi
further, however, I note that it is deem
advisable to have a sufficient quantity gro
ing in the greenhouse in order that the hom
sick plants can be hustled back for tre
ment. It will be some months befo
Begonias will be again in bloom. This w
give growers time for thought and discussio
otherwise I would advise their going wari
before taking their choice doubles indoor
With regard to the photograph publishe
would Mr. Greaves kindly tell us wheth
the Begonia was photographed when fir
taken indoors or at the end of three weeks
It would be helpful to your readers if oth
Begonia growers gave their experience.

E. R. BLUNSDEN.

[I do not think my experience wit

tuberous Begonias as house plants is at all uncommon. In reply to Mr. Blunsden's query I may say that the photograph reproduced in your issue of November 17th was taken when the plant had been in the house just over a fortnight, but when my note was written, about a week after, the plant was in the same flourishing condition. It is by no means difficult to maintain a house atmosphere thoroughly congenial to tuberous Begonias during the summer months. The plant in question spent a portion of its time in an open, sunny window, and the remainder of the day on the sideboard, and due attention was given to watering throughout its stay indoors. The reason why many plants fail when brought indoors is that they are more often subject to neglect. Greenhouse plants are visited regularly, but the care of the house plant is anybody's job, which means too often that it is nobody's job.—H. Greaves.]

Treatment of Nepenthes

I SHOULD be grateful if you could give some details through the columns of your interesting paper as to the cultural treatment of Nepenthes Khasiana (the Pitcher Plant), of which I have recently been given a well-grown specimen. A. H. Whelan.

C/o The National Bank of
India, Ltd., Bombay, India.

[There are many species of the Pitcher Plants, the majority of them being natives of the Indian Archipelago, although there are also varieties which have been obtained by cross-breeding in British and American gardens. The species N. Khasiana comes from the Himalayas and has green pitchers marked purple. All Nepenthes are surface-rooting plants and must be potted in rough fibrous peat and Sphagnum Moss. Drain well and water very freely both by means of the watering-pot and of the syringe. The plants enjoy a strong heat and a moist atmosphere, but they must not be exposed to the full influence of the sun. It may interest our correspondent in India to learn that Nepenthes may be raised from seeds. Seedlings grow away fairly quickly after germination takes place. The foliage bears tiny pitchers very soon after the seeds germinate.]

TREES AND SHRUBS

Privet hedge dying

(Mrs. Hungerford).—It is impossible for us to say what is the cause of your Privet dying unless you send us some specimens for examination. It appears likely that something has killed the roots. Please send us some of the dying growth and also a portion of the root from one of the affected plants and we will report in due course.

Four sweet-scented "single" Lilacs wanted

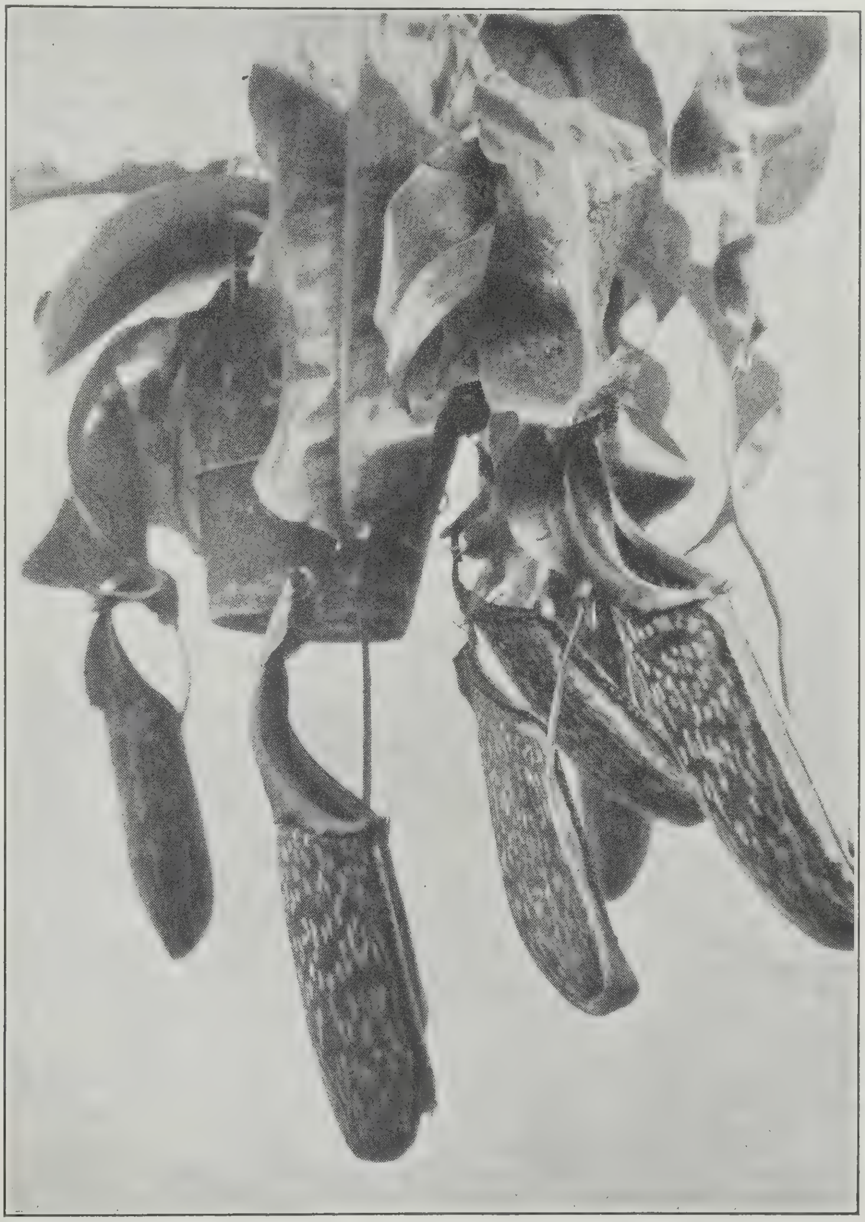
(Pakeha).—White, Marie Legraye; rosy-lilac, Mme. Francisque Morel; deep purple, Souvenir de Louis Spath; red, Phelemon.

VEGETABLES

Diseased Celery

I am sending you a specimen stick of Celery. All in the garden has failed this year. It was earthed-up in good weather with brown paper packing. Can it be possible the ground was over-manured? A. R.

[Your Celery is attacked by Celery Heart Rot, which is caused by Bacillus carotovorus. This bacillus is the cause of a soft rot in many kinds of plants and is difficult to control. Your best plan will be to lift all the affected plants and burn them. The site on which the Celery is growing should not be used for Celery, Carrots, or Onions next year because each is liable to attack. The manuring may have had something to do with the disease, *e.g.*, the organism may have been introduced into the garden by means of the manure, or if the plants had received too much nitrogen from the manure it may have made them soft in growth and therefore an easy prey to the bacillus. We are inclined to this view because all the leaf-stalks were pithy. You would find that your Celery plants would be improved another year by giving the trenches a dressing of three parts superphosphate of lime and one part sulphate of potash at the rate of 1 oz. per yard run of trench. If you can improve the drainage of your land it helps to keep diseases of this character in check. Lime increases the chances of attack.]



Nepenthes or Pitcher Plant

Stove plants that require a high temperature and abundance of moisture. Even in winter the temperature should not be lower than 60°

Garlic trouble

Kindly inform me if there is any method of destroying or holding in check the common or wild Garlic other than digging it up. A portion of our grounds in which bulbs are thickly planted and which we wish to avoid disturbing contains a great deal of it, and it appears to be increasing rapidly. In early spring, before the grass begins to grow, the clumps of dark green foliage are too conspicuous. William J. Harris.

[We do not think you can do anything except lift the Garlic and destroy it. Anything which you could treat the soil with would, if it killed the Garlic, also kill the bulbs. If you could prevent the Garlic making any foliage you might be able to weaken it in time so that it would die out, but we are afraid it is rather a forlorn hope. Garlic in such a position is almost a hopeless proposition, but to lift and destroy seems to be the only method, if it is practicable.]

Potato Sefton Wonder

(C. D., Berks).—Having grown Sefton Wonder we have no hesitation in saying that it is a Potato for every grower. Anywhere where Potatoes can be grown it will give satisfaction. It is certified by the Ministry of Agriculture as a new and distinct immune Second Early variety. It is earlier and a better keeper than its parent, Great Scot. It has a similar sturdy growth, but has a beautiful golden russet skin, and the flavour of that epicurean Potato, Golden Wonder, even when dug early in its immature stages. Well sprouted, and planted early, it compares favourably with any First Early variety.

FRUIT

Paradise stocks for Apples wanted

(Pakeha).—Messrs. George Bunyard and Co., The Royal Nurseries, Maidstone, possess a very fine form of Paradise Stock known as the Broad Leaf of Rivers, upon which their Apples are worked, and they would probably supply you with all you require.

Rabbits eating Apple trees

A rabbit got into the grounds here a short time ago and started gnawing at some new Apple trees which had recently been planted. The base of the stem of each tree was then smeared with gas tar. We so treat young Spruce trees which are planted in the coverts to keep the rabbits from them. A man living near has since told me that such treatment of young fruit with either gas tar or creosote is bad for the bark of the tree, and such system should not be carried out. I shall be much obliged if in your columns you will kindly tell me if any harm is likely to result to the Apple trees from our treatment. MAJOR E.

Knowle.

[We agree that it is dangerous practice to treat the stems of young fruit trees with tar or creosote to prevent rabbits eating the bark. We have seen many trees killed after being so treated, and the rabbits may just as well kill a few of the trees as for you to injure them all by your treatment. The best and safest treatment to prevent rabbits eating the bark of fruit trees is undoubtedly to wire the enclosure or to wire each tree. Many experiments have been tried as to material for treating the bark, and, while success is claimed by some, a repetition with the acclaimed material does not work under all conditions. Protecting the bark first of all with grease-proof paper and then using tar is, perhaps, the best preventative. Another plan we have seen successfully used was to tie small bundles of dead twigs around the stem, but it appears to us that if there is any quantity to protect, wiring would work out cheapest in the end. It is curious that rabbits and hares often injure newly planted trees, but often leave untouched those that have been in position several years.]

Mealy Bug on Vines

Kindly tell me the best way to deal with Mealy Bug in Grape Vines under the following conditions:—The vinery is used for other plants, including Cinerarias and Primulas, also Ferns, and Smilax is planted under the wall of the vinery. I have no other house in which to move the pot plants, so I am unable to fumigate owing to the other plants. R. H. TUCK.

[Please see reply to "Cum" on page 711 of our issue for November 3rd *re* fumigation with calcium cyanide. We think that if you use calcium cyanide in very light doses fairly often you would in time reduce the Bug; at any rate, to reasonable proportions. The firm from whom you obtain the calcium cyanide will give you full instructions as to how the material should be used and also what plants are injured, but most plants will stand very light doses. If you do not care to use this material the Bug actually on the Vines could be killed by scrubbing with Gishurst Compound. A house filled with miscellaneous plants *plus* a Vine is always difficult to keep free from Mealy Bug. A mixture of half methylated spirit and half water is useful for painting the pest on the Vine during summer, but even at that period calcium cyanide is the quicker method. *Re* a shady greenhouse, you cannot be expected to grow good plants or Vines in a house shaded in the manner you describe, and for you to obtain good results it is essential that the shaded conditions should be removed. On the other hand, the shaded conditions have nothing to do with the spread of Mealy Bug. The facts are that the Bugs are present in the house and go on increasing as long as they are allowed to remain and have food plants.]

Fruit trees for west wall

We have suddenly decided to do away with Loganberries on a wall facing due west and put in oblique cordons—Greengages, Plums, and Pears—and I should be so grateful if you would tell me if we can put them in early in the spring, or if we must wait till autumn. I am going to have the border trenched and manured at once, and I do not think I can have it ready, even if the weather suits, before the latter end of January, as labour is a difficulty. If you say we can plant this spring would you kindly give me the names of suitable trees? We have Pitmaston Duchess and Williams' Bon Chrêtien, and I should like a smallish sweet early Pear, one of those delicious, juicy things I have eaten but of which I do not know the name. It will be most kind of you to help me. M. A. PILKINGTON.

[Your decision to do away with Loganberries is a wise one; a west wall is much too valuable for these rather over-rated subjects. You can plant Pear trees and Plum trees from now until the middle of March, although, of course, late autumn planting, when it can be done, is preferable. Meantime prepare the stations. Take out good-sized holes, 2 feet in depth, and refill at least 1 foot with good turfy loam well chopped, to which should be added some lime-rubble or lime in some form, with a little bone-meal. The remaining soil may be returned at planting time, afterwards mulching the surface with strawy litter. See, too, and especially during March and April, that the trees have plenty of moisture. Oblique cordons planted 2 feet apart would be suitable. Good Plums would be Kirke's Plum, Washington, Jefferson, Coe's Golden Drop, Reine Claud de Bavay, Brahy's Gage (early and late), and Transparent Gage. Pond's Seedling makes a good, large variety, but it lacks the quality of the others. Pears might include, in addition to those named, Beurré Giffard (small and sweet), Hessle (ditto), Winter Nelis (ditto, late), Louise Bonne of Jersey, Beurré Hardy, Marie Louise, Doyenne du Comice, Autumn Bergamot, Glou Morceau, and Josephine de Malines.]

Orange trees in tubs

(F. T., Ciboure).—If the trees appear to be very badly attacked by scale there is nothing else for it but to constantly syringe them with an approved insecticide or solution of soft-soap and water, after first of all sponging the leaves with soft-soap and thoroughly scrubbing the bark of the trees. This is a long and tedious job, but it must be done thoroughly. The ants are not doing any harm, they are merely present to take away the honey-dew deposited by the aphis. It is a good thing to thoroughly cleanse the trees, especially at this dull time of the year. The reason why the fruits do not mature is probably because the trees are not in good condition; also it may be due to the Orange-blossom not being properly fertilised. If the flowers are not visited by insects, then it is necessary to pollinate them by hand, dusting the flowers over with a hare's tail about mid-day, when the flowers are open and the pollen is ready to dehisce.

MISCELLANEOUS

Fog in lawn

I have to thank you for your most kin answer to my question *re* "fog" in lawr "Fog" is, perhaps, better understood "Moss." If, however, you do not qui understand I will be very glad to have a piec sent on for your inspection. It is not a gra or plant, but more like the material used retain the moisture in Orchids. My own ide is to have the lawn top-dressed with a coatin of good, sharp sand. N. R. J.

[We are interested to learn yet anothe name for Moss in a lawn. Your plan giving the lawn a top-dressing of good, shar sand is a sound one. It would be best fo you to commence operations by giving th surface of the lawn a vigorous raking wit an iron rake to remove as much of the Mos as you can. Follow this by obtaining besom which is almost worn out and, there fore, stubby, and brushing the surfa thoroughly, again to remove as much of th Moss as is possible. To allow the sand work well into the top soil and turf we shoul loosen the turf with a digging-fork, just pres the fork home, and gently raise the surface the turf; then top-dress with the sand an allow rain to wash in the sand; afterwar roll well. The growth of Moss on a lawn often due to bad drainage. Are you sure th drainage is good? To spend labour on badly drained lawn is largely waste of tim and the Moss will grow again. Follow th above treatment by giving sulphate of am monia in April at 1 oz. per square yard.]

Hardy Cyclamen seeds wanted

("Reigate"). — Messrs. Thompson an Morgan, seedsmen, Ipswich, are the on firm we know who offer seeds of these har Cyclamen. Their seed list not only contai the kinds you mention, but several others interest.

Address wanted

Will our reader, Alice Kirke, who recent wrote Mrs. Torkington, The New Ha Maidenhead, with reference to Campanu Allionii, kindly get into touch with her agai

NAMES OF PLANTS

Cæsar.—Hymenanthera dentata R. B Var. Angustifolia Benth. Fl. Aust., 1, 10 See Cheeseman, "Manual of the Ne Zealand Flora," page 49. More recent introduced to gardens than H. crassifolia, only bushes of lesser size are known. seems to have a stiffer, more upright ha than the older species, loses its leaves mo readily, but bears small white berries of similar size. The tips of young growths pr duce few leaves and stand out from the bu as grey, sharply pointed twigs, and a pleasantly distinct in appearance.

A. B.—The Veronica with stems li polished whipcord is V. Hectori.

C. T., Surrey.—Raphiolepis ovata. It also known as Japanese Hawthorn.

Register of Growers of Certifie Stocks of Potatoes

During the past season Inspectors of t Ministry of Agriculture have examined near 9,000 acres of growing crops of Potatoes wi a view to certification as found to be true type and reasonably free from rogues. Pa ticulars of crops certified as reaching t required standard of purity of not less th 99·5 per cent. are given in the Register Growers of Certified Stocks of Potatoes 1928, which has just been issued by t Ministry.

Growers are reminded that, under the Wa Disease of Potatoes Order of 1923, the on Potatoes that may be planted in land which Wart Disease has occurred at any ime are Potatoes of approved immune varieties which have been inspected whilst growing and certified as true to type and easonably free from rogues, or Potatoes of approved immune varieties saved from crops grown on the land in the previous year. The Order further provides that, on the sale of any Potatoes for planting, the number of the relative certificate issued under the Order must be quoted. In the case of Potatoes of approved immune varieties, the certificate number to be quoted is that given in the Register of Growers, but in the case of other varieties the number to be quoted is that of he relative Clean Land Certificate issued to he growers concerned, and not that of the Purity Certificate quoted in the Register.

Copies of the Register of Growers may be obtained from the Ministry on application to ts Offices at 10, Whitehall Place, London, S.W. 1, price 1s.

Jottings from the Riviera

A SEASON of extremes in temperature, drought, and rainfall has made its mark in gardens on this sunny coast. How many old favourites have disappeared, killed at the root either by drought or heat, and yet how many have enjoyed it as reminding hem of the climates from which they have sprung! The flowering Aloes have especially enjoyed these conditions, and should, with ordinary weather, give a glorious harvest of bloom later on. The little Iris stylosa or unguicularis, when cut back in September to "bare bones," are now one mass of flower, and it is pleasant to chronicle the fact that this severe treatment has proved very successful in England, also, as the check seems to force up the flower-buds.

Many climbers and plants are late as the drought and heat persisted till mid-October, and the three weeks' deluge that followed entirely spoilt the late summer flowers, but Roses are very unusually good, having been well rested during the summer months, and the autumn Sweet Peas have equally enjoyed the conditions. Both Anemones and Narcissus are much later than usual; the ground was too hot for them to start till after the rain of early November. Since then the constant sunshine and even temperatures have produced a harvest of flower I have rarely seen at Christmas time. The Salvias and Phlox Drummondi, with bold groups of Centaurea Clementei and the Orange Cosmos igneus, give an air of summer that is a surprise to newcomers, while the Hellebores or Christmas Roses and the Snowdrops are only just beginning to recover from the heat and drought. The Cyclamens have found the conditions extremely favourable. I never saw finer leafage or promise of blossom; a few C. persicum are already opening their first blooms.

Carnations suffered so much from the heat and drought that it was not until the autumn rains and cooler air that the growths could consolidate. At this moment they are in fine condition, a great contrast to the entire blank of last year after that terrible frost of December 18th. The cool nights and bright days of this season are much to their liking.

Cypripediums insigne in variety and their hybrids are in profuse flower, while the charming late autumn Nerines of the Manselli type are almost a failure, owing to my gardener's fear that the heat and drought of summer would be too much for them, so he watered them once every fortnight, with the result that only a few pots sent up any flower-spikes. Had they simply been covered up from the sun's heat and left dry I have little doubt but that their flowering would have been normal. It is the difficulty of knowing exactly how to rest Nerines that prevents their culture being more general.

Yuccas, especially Y. gloriosa, have responded marvellously to the heat and drought. There are more flower-spikes in beauty now than I have ever seen so late, and the contrast between the pure white Gloriosa spikes and the brightly tinted buds of hybrid seedlings are very effective. In this climate I find it a good plan to pull out all the spikes that come in spring and early summer while they are quite young, and the autumn blooms are more abundant in consequence.

EDWARD H. WOODALL.

British Trade journals

A new departure in trade journalism is announced by Benn Brothers Ltd., which recently acquired the business of William Agnew, Ltd., publishers, of Mark Lane. William Agnew, Ltd., were the publishers of "The British Trade Journal," among other papers. "The British Trade Journal" was the first export trade journal, and has led that field for the last 67 years. Benn Brothers Ltd. established 30 years ago "The Export World," which has had a highly successful career.

It has now been decided that these two publications should join forces under the title of "The British Trade Journal and Export World." The first number of the combined publication, which will be larger, more comprehensive, and more influential than any export journal ever published, will appear in February in good time for the business opportunities presented by the British Industries Fair.

Another Modern Colas Drive!

One drum containing 30 gallons costing 40/-, delivered direct to destination within the Railway Company's free delivery area, will cover approximately 100 sq. yds. of gravel drive or path. A considerable reduction is offered if two or more drums are ordered. Write to Estates (K) Department for 24 page booklet and prices.

A TIMELY dressing of Colas will save you any amount of trouble and expense. It will give your drives and paths a new lease of life at a low initial cost *without spoiling their appearance.*
Colas requires no skill or special apparatus and arrives *ready to apply*, while equally satisfactory results are obtained in Winter or Summer.

Where can I obtain?

THE difficulty of not knowing exactly where you can secure some special line needed for the garden — probably recommended or seen elsewhere—is easily overcome by utilising the services of "G.I."

Considerable care over a number of years has been given to tabulating information on all aspects of gardening that shall prove of assistance to our readers.

Write us, therefore, when you want to know where to obtain any seeds, plants, shrubs, horticultural implements, sundries, or other accessories to the garden that you do not see advertised in our pages.

Address your enquiry, with stamped envelope for reply, to—

Among the Hardy Flowers

I WOULD like to bring before other amateurs the merits of the Heliopsis, a good border plant with flowers like those of small Sunflowers, but coming into bloom before the perennial species of Helianthus. I have found the plants of this genus of good appearance towards the back of a border; and the blooms come in usefully as cut flowers, especially if cut before the disc or central florets have opened. Cut at this stage they keep fresh much longer. Of the genus there are several species or varieties in nurseries, and I have grown a few in my own garden. They all grow to a height of 3 feet or 4 feet and give a long succession of flowers. The three mentioned are, I consider, about the best. Heliopsis major, sometimes called H. scabra major, is a good one, with large, ingle, deep yellow lowers. Then, one which was, I understand, introduced a good many years ago as H. pitcherianus, has an additional row of ray lorets and is of a good orange-yellow. The newest of the varieties is H. zinniæflora, which is he most distinct form we have among the plants of the genus. It as double flowers ormed like those of a Zinnia and of a good range-yellow. Any of hese will grow in good arden soil, but to do hem justice I consider hat they should be well nanured. They should e staked in good time, s, although quite obust, they may be blown over in stormy eather.

The Cape Hyacinth (Hyacinthus or Galtonia candicans)

Bulbs should be ordered now for spring planting

The tall spikes are from 4 feet to 6 feet high, each bearing from forty to sixty pure white bell-shaped flowers

HE CAPE HYACINTH

From what I see the Cape Hyacinth altonia, or Hyacinthus candicans, is a bulb hich is not so much grown as it was a few ears ago. Some of my friends to whom I ave spoken about it inform me frankly that ey always forget about bulbs for spring anting, with the possible exception of ladioli and Anemone. This is a pity, as eil-grown plants of this Galtonia have a stinct value in the garden, especially where her hardy flowers are much grown and where groups or masses of this noble flower are splendid when in bloom. When well grown in good soil they will be from 4 feet to 6 feet high, and will look really superb with their numerous white flowers on elegant plants. There is just one trouble worth mentioning, and this is that if the plants are left in the ground during winter they often deteriorate in some gardens and come up quite dwarf and stunted. This would seem to happen more frequently in cold, wet districts; and the only thing to do is to lift the bulbs when the foliage withers in autumn and keep them free from frost until March, which is the best time to plant. G. candicans is now so cheap that it should be largely planted.

HEPATICAS

Most growers of hardy flowers love the old Hepaticas, now classed among the Anemones by botanists, but more familiarly known to both amateur and professional gardeners as Hepaticas. I rather like the old popular name of Noble Liverwort. But this is a digression, and I intended, when I began, to say a little about the cultivation of these old-fashioned flowers. An experienced grower of them once told me that a great point in the successful cultivation of the Hepatica is to keep the foliage fresh as long as possible. This means that the plants should have, at least, partial shade, either by planting them in a shaded place or by putting something over them after they have flowered to keep the sun off them. This, he said, was only natural, as they are mostly woodland plants. He suggested branches of Spruce or other Conifers over the plants. This may not please some people, who would sacrifice everything for tidiness, but lovers of the Hepatica will not mind this if it secures good plants with plenty of flowers. The soil should be rich and deep, with plenty of leaf-soil, but the planting should be done firmly. I like the grand varieties of Hepatica or Anemone angulosa, but there is something inexpressibly appealing in the smaller flowers of the old favourite Anemone Hepatica, the Noble Liverwort of our ancient writers. — AN AMATEUR OF HARDY FLOWERS.

Galtonias (Hyacinthus candicans)

SOMETIMES one hears disappointment expressed at the non-appearance of Galtonias in the flower borders in the spring by people who have looked upon them as entirely hardy. It is certain that in some soils that are light and sandy it is safe to leave the bulbs in the ground for the winter without harm, but on soils that are cold and heavy there is considerable risk in so doing. The safest plan is, I think, to lift the bulbs after they have done flowering in autumn, and to store them in sand in a shed or cool place out of the way of frost. The foliage should not be cut away, but left to dry off naturally, just as one does with Gladioli. My plan is to tie them up in bunches with the bulbs up, so that the moisture does not drain into the bulbs, causing them to rot off. They keep well enough in sand for the winter, and can be replanted in March. Do not leave the bulbs to chance in the soil. MIDLANDER.

Early morning frost scenes can be surprisingly beautiful in winter

On the left is a glimpse in the rock garden; and on the right a Tamarix with its twigs wreathed in hoar frost

NOTES OF THE WEEK

National Rose Society

THE 52nd annual general meeting of the Society will be held at Caxton Hall, Victoria Street, Westminster, S.W. 1, on Wednesday, January 16th, at 2.30 p.m. The chair will be taken by Mr. Arthur Johnson, the new President of the National Rose Society.

The Ricardi Irises

The article in our last issue on the beautiful Ricardi Irises, with a warning as to their hardiness, has, as we expected, brought correspondence from leading Iris enthusiasts. In this issue we publish an interesting letter on the subject from Mr. G. L. Pilkington, the Hon. Secretary of the Iris Society, who, as is well known, is one of the most successful growers of Ricardi Irises in the country. As Mr. Pilkington rightly points out, at least 90 per cent. of the Bearded Irises are hardy border flowers in any part of this country. Those who wish to be kept informed on Iris matters such as these would, we suggest, do well to join the Iris Society. The Hon. Secretary's address is Lower Lee, Woolton, Liverpool.

Pensions for aged gardeners

There are 36 deserving candidates, of whom only 20 can be elected to the funds of the Gardeners' Royal Benevolent Institutio at the forthcoming annual general meeting The election this year will be held at th Connaught Rooms, Great Queen Street, o Thursday, January 24th at 3 p.m., when th chair will be taken by Mr. Leonard Sutton Chairman of Committee. Subscriptions an donations are earnestly solicited. Th Secretary is Mr. George J. Ingram, 92 Victoria Street, Westminster, S.W. 1.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Dianthus sylvestris

I WONDER if any readers of GARDENING ILLUSTRATED would be interested to hear of my experience with that little-known Alpine, Dianthus sylvestris? It has such a bad reputation—that, I suppose, is why it is so seldom grown—but is so graceful an beautiful that it is a pity that it is not see more often. In all ignorance of what I wa getting I brought it from Switzerland my self, giving it most unsuitable treatment fo a fortnight or more while I was movin about. When I got home I put it into rather shallow old stone sink on a terra facing south. There it has been for sever summers now, and always flowers wel Unfortunately, the birds are fond of it, an either nip the buds off or tear the flowers ribbons unless it is well protected. I alway give it plenty of water from about April ti the flowers are over.

(MISS) A. H. DODSON.

Wootton Rectory, Northampton.

A standard colour chart

There is published in France " Repertoi de Couleurs des Fleurs, des Feuillages et d Fruits," published by the Société Françai des Chrysanthemistes et Rene Oberthu ouvrage couronne par la Société Nationa d'Horticulture de France.

In my opinion it would add greatly to th value of this really important proposition the Royal Horticultural Society would tak it up.

In " Hunting in Africa, East and West, by C. P. and R. C. Curtis, page 265, th authors say : " The colour book was perfectl

Anemone Hepatica triloba, flowers single blue

This is one of the shade-loving Noble Liverworts referred to on the previous page fascinating. Every colour shaded here, 1,431 in all, were classified and named."

Japanese landscape in a square earthenware dish, comprising a lake with bridge, thatched cottage, Bamboos, pagoda, Junipers, and other trees

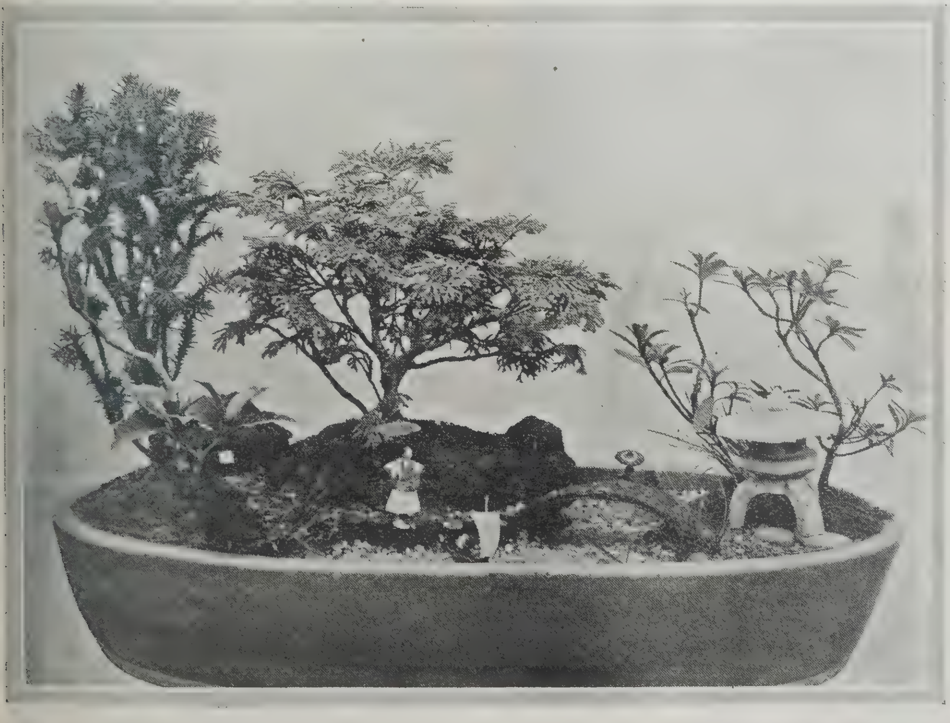
Hachi-niwa: Pie-dish gardens

WHEN the little dish gardens appeared in England in shops where Japanese goods were sold, and first were seen in some of our flower shows, they were treated merely as toys for children, and raised a smile, though possibly one of appreciation. The art of representing a well-known scene, a perfect landscape, or charming garden within a space measured by inches was certainly not taken seriously. Within the last few years these miniature gardens have become far more popular, and there is something very fascinating in building up such little pictures. Although a good deal may be learned by the study of a well-constructed one, far more is to be learned by laying one out, and many happy hours can be spent in making these delightful little gardens. Small temples, shrines, thatched cottages, lanterns, and bridges, Torii, boats, and the most beautifully modelled figures—perhaps less than an inch in height—representing coolies, pilgrims, priests, and Japanese ladies in their picturesque dress may all be purchased at an astonishingly low price. Pigmy trees representing venerable Pines, specially grown and dwarfed, can also be obtained at prices which vary from pence to pounds.

At Kyoto an exhibition is held annually of these little living gardens and landscapes. Handsome prizes are awarded to those considered the best. The making of these Hachi-niwa is a favourite pastime for the ladies of Tokyo, but the interest in them is not confined to women and children, the exhibitions are thronged with the best-known men in the land.

There is no doubt whatever that the construction of such small gardens in the British style, with all the miniature accessories, such as those provided by the Japanese, would do much to encourage the art of garden design.

In many a household a Japanese dish garden, given as a toy to the children, has become a source of delight to the parents. One can picture a charming little scene representing an old Tudor garden or Dutch garden, such as may be seen at Hampton Court, carried out on a scale only occupying a foot or two of space. But to obtain perfect little models of ancient garden houses, sundials, and little figures, perhaps of the Tudor and Stuart periods, when our native dress was picturesque, we should probably have to go to Japan to get them made accurately and cheaply. The great thing to be remembered in their construction is to get everything in proper proportion, not only as regards each accessory used, but also as regards the size of the shallow dish in which the whole scene is built up. It is a fascinating and delightful art and it adds a new interest to some of our little native plants that we sometimes call weeds, but there is a beauty in Chickweed, Eyebright, and the Shepherd's Weather Glass. H. H. WARNER.



A pie-dish garden

Ricardi Irises

I have read Mr. Wynn Hellings' article in your issue of January 5th with great interest, and am in agreement, to a large extent, with all he says, particularly with regard to the necessity of informing the general public on the subject of the "hardiness" or otherwise of the modern garden Irises.

The fact remains, however, that 90 per cent. of the Bearded (Flag) Irises listed in the growers' catalogues to-day are perfectly hardy, another 5 per cent. may be called fairly hardy, and the remaining 5 per cent. admittedly difficult to grow under our average weather conditions. To this latter category most of the so-called "Ricardi" Irises belong.

Iris Ricardi itself, as Mr. Wynn Hellings states, originally came from a warm climate, and, owing to the fact that the weather of the summer and autumn in this country is often so consistently wet and comparatively sunless, the rhizome rarely gets properly ripened, and the plant fails to flower in consequence, and in course of time often dies out entirely.

The fact that certain people can grow these Irises satisfactorily is almost entirely accounted for by a combination of circumstances, such as "good position" in the garden and weather prevailing in their particular district.

As I live in a district where the rainfall is heavy and the winters usually mild, I have adopted the method of giving protection from rain in the form of overhead glass shelters during the autumn and early spring, and find that this solves, to a large extent, the difficulties of growing these Irises; and, whilst admitting that Irises requiring such treatment cannot be regarded nor recommended as "garden" Irises in the true sense, I am of opinion that by judicious hybridising a race of Irises possessing most of the qualities of Iris Ricardi as regards size of bloom and flower-spike, together with the necessary "hardiness" for our garden, can, and will, be evolved.

Several of the Irises mentioned in Mr. Wynn Hellings' list are extensively grown in amateurs' and "growers'" gardens, and can be generally classified as "hardy," notably Mdlle. Schwartz, Leverrier, Fismes, Menetrier, and Troost, which latter, however, Mons. Denis informed me, is *not* a Ricardi seedling, though erroneously stated and accepted as such in many trade lists both here and on the Continent.

It should be noted, also, that practically all the Irises in this list are " first crosses," and, as such, can hardly be expected not to exhibit the characteristics of their " tender " parent to a large extent. Later generations, however, may certainly be expected to outgrow them, and it is towards this end that some of us enthusiasts are striving.

On the other hand, Iris Cypriana (which was sent to the late Sir Michael Foster from Cyprus in 1888) must not be confused with I. Ricardi, and Iris lovers must bear well in mind that had it not been for the Cypriana and the work of the late Sir Michael Foster, who used it so largely in his hybridising, our gardens would be without many of the tall, branching varieties which adorn them to-day. Such well-known varieties as Caterina, Lady Foster, and Shelford Chieftain are all direct descendants of I. Cypriana, and, furthermore, this Iris has been used much by Mr. Yeld and Sir Arthur Hort in the production of many of their finest Irises.

Gentiana verna angulosa growing and flowering well in a stone sink

Gentians, Saxifrages, Dianthuses, Androsaces, Campanulas, and other Alpines may all be grown successfully in stone troughs and sinks. Apparently the plants love it!

The suggestion by Mr. Wynn Hellings that growers should list the Ricardi Irises under a separate category in their catalogues would seem to be a simple method of informing the general flower-loving public on this question, and I trust that it may have their consideration.

As to the " rating " or " judging " of such Irises, a suggestion that they should be placed in a class by themselves for this purpose is probably correct at this stage, and has already been discussed, in its broadest outlines, by the Committee of the Iris Society.

The following " Ricardi " hybrids can be added to Mr. Wynn Hellings' list, and are added largely as a matter of interest, as very few of them will be found in the catalogues of our English growers, but chiefly in Continental ones.

The list does not include any of the American-raised varieties, which are largely of Mesopotamica parentage, and, as such, would necessarily fall into the same category as the Ricardis, as regards their hardiness, until proved otherwise. Megas, Mdlle. Jeanne Bel, de Forcrand, Jeannie, Peronne, Prof. Scheubel (all Denis), and Mopsa (Hort).

G. L. Pilkington,
Hon. Secretary, Iris Society.

—— I think Mr. Wynn Hellings is unduly pessimistic on the subject of Ricardi Irises. I have grown some 30 varieties since 1922, first in Southampton and later in Richmond. I have discarded some of them as superseded, but I have only lost two varieties from disease, and these arrived in that state from damp packing, and so never got started. The soil in both gardens was light, and there was good shelter from wind, but no special treatment was given. I was able to show a number of varieties at the Iris Society's show in 1927. Even after the very wet summer and autumn of 1927 and the severe winter I had practically all in bloom last summer, but, unfortunately, they were over before the show in many cases.

As the raising of seedlings is an easy matter, it is to be hoped that those in whose gardens these varieties bloom are raising seedlings from them so that even stronger varieties may be found. I have been doing a little myself since 1926, using several Ricardi varieties as seed parents. Nothing much appeared among the first set, which bloomed last summer, but, at any rate, they came through the winter quite well. I have at present a further set of seedlings from S. Autissier, Säull, Mme. Vermoux, Mme. Durand, Mdlle. Schwartz, Mme. C. Bouscant, and J. B. Dumas, which have made good growth and, so far, are standing the winter well in my new garden, which is quite different soil. B. R. Long.

Lucan, Square Hill Road, Maidstone.

Olearia insignis in the rocks at Kaikoura

Mr. A. Wilkinson, the veteran Treasurer and Secretary of the New Zealand Alpine Rock Garden Society, writes to Sir William Lawrence, dated November 24, 1928:—" I am writing this letter in Kaikoura, where I am staying. Mount Fyfe is in front of me, about five miles, and it is a great sight. Covered with snow and a perfect summer's day. The rocks all along the coast within three miles are covered with Olearia insignis; it is a wonderful sight. Roots just in cracks of rock. No soil, and they are one mass of buds. Then Veronica Hulkeana all about on slopes in full bloom and Linum monogynum growing in profusion. The leafless Clematis just over." We also learn that the headquarters of the Society have been moved from Nelson to Wellington, N.Z.

A dissertation on pig troughs

It can never have entered the head of any patient hewer of stone pig troughs that age would enhance the value of his utilitarian handiwork, but time has brought bargainings behind closed farm doors and motor cars driven furiously through the night laden with erstwhile porcine feeding utensils.

Stone sinks and troughs have opened up endless possibilities in Alpine gardening, and personally I think there is no more enjoyable way of growing the newer Saxifrage hybrids than in a stone sink built up with rocks rising high above the sink sides to resemble a considerable out-crop. By this means every aspect is easily obtained, the plants are thoroughly at home, can be enjoyed at close range, and are at hand for propagating.

Even those who have already a collection of these miniature gardens may not have quite realised what gems will live happily therein. Recently I saw a trough which was a masterpiece of arrangement and planting. Its inhabitants will, I think, be of special interest to those stricken with what for want of a better word I will call " Troughitis."

Here is the list, and first of all come the Saxifrages and Primulas:—

Saxifraga Primulaize, S. Tæssalica, S. Cecil Davis, S. Grisebachii (Wisley Variety), S. x The Duke, S. oppositifolia splendens.

Primula pubescens alba, P. Deschmannii, P. fasciculata, P. serratifolia, P. hirsuta, P. intermedia, P. Wulfenniana, P. Allioni, P. Auricula albo-marginata.

Next an isolated treasure, Dianthus musale. Now the rather stronger-growing or carpeting plants, Armeria cæspitosa, Arabis lucida variegata, Potentilla Breweri, Erigeron umbellata, Veronica Astonii, with last of all a miniature Noah's Ark tree, Juniperus communis compressa, and a quaint little Ivy, Hedera conglomerata minima, to give proportion.

To those who have tasted these little Alpines this is, surely, a most sustaining trough of rare and refreshing fare.

F. H. Fisher.

Sternbergia lutea

The writer (issue January 5th, page 4) expresses so exactly what I felt on reading the two contrary recommendations for successful flowering of the above that I, too, give my experience. My plants have never been moved, and are in very dry soil fully exposed to sun in a sheltered garden, and each year have thrown up fewer flowers, but never so badly as last year. In one of your issues some time ago it was said that if the Sternbergia lutea produced offshoots they would not flower. This has been the case with mine, and I want to know how it can be prevented, and if it is any use taking up these subsidiary plants and replanting them.

" Bosmere."

—— Writing from my experience in the south of England, I agree with " C. T. K." that if we want Sternbergia lutea to flower we must on no account disturb the bulbs when once planted. I was much surprised that Mr. S. Arnott should advocate taking the bulbs up every year in order to ripen them off, but I imagine this is because he has grown them in a cooler climate than in the south or west of England. My great-grandfather flowered them year after year uninterruptedly in Hertfordshire, planted in friable loam on a border facing due south, backed by a high brick wall. They continued to bloom during my grandfather's lifetime, and a clump lifted with as little disturbance as possible was dropped into a similar position in my father's garden nearby, where they blossomed for many years (30) without a break. These clumps were never listurbed yearly. It would have been regarded as an act of sacrilege.' I brought some to my present garden three years ago, ind for the last two years they have borne a ew flowers planted in a warm position acing south-west, and I would on no account disturb them. When one is dealing with a species and not some florist's variety he less disturbance plants receive the better, believe. This is certainly the case with ris unguicularis. The Agapanthus also resents disturbance. A large clump or two appeared to be potbound and were divided and ransplanted to larger pots. Plenty of leaves were produced, but it was some years before hey began to bloom. Exactly the same hing occurred with Eucaris Amazonica. They, like the Agapanthus, appear to enjoy pressure on the roots, and I believe this is also the case with the Algerian Iris and the Sternbergia. The motto, surely, is "let well alone." Imported bulbs of Sternbergia often reach England in a very dried-up condition, and have sometimes been removed rom their native land at the wrong time of ear, but if they can be obtained from France, or, better still, taken from the open in some English nursery, they are far more likely to succeed, as they have become acclimatised to our less sunny country. It must be remembered that they are natives of Asia Minor and he Caucasus. One correspondent who recently mentioned them and how easily they lowered in almost any position wrote from he island of Majorca, which, we believe, is iterally baked in the summer.

Brighton. H. H. W.

Sedum spathulifolium purpureum

I HAVE been growing this plant for a good many years now—several years before the war if I remember rightly—and as each eason passes I come more firmly to the conclusion that it is, without doubt, the finest stonecrop in cultivation. The old grey-leaved type of S. spathulifolium is a first-rate plant, but the purple variety with its larger, flatter leaves of a beautiful plum-purple with a delicate grey bloom over them, and changing in winter to fiery reds and oranges s really a superb thing. Any sunny position and light soil seems to suit it, and it is simply nvaluable for giving a touch of colour, character, and interest in the rock garden during the dullest months. The flowers, too, are handsome, broad heads of rich golden-yellow on red stems, but for its foliage alone he plant is in the first class without the added glory of blossom. My original plant was sent to me by some private collector in British Columbia, and I only wish I could remember who exactly it was who did me his good turn. I quickly worked up a stock, and was soon able to distribute it. I remember some plants which I sent to the Wisley ock gardens did particularly well there. If his note should reach the eye of the good riend who sent me my original plant I must say I should like to get in touch with him or ier. CLARENCE ELLIOTT.

Proposed Society of Garden Architects

I have read with some interest the communications which have appeared in these pages regarding the above suggestion, and I now request the favour of a little of your valuable space for a few comments thereon.

In the first place, I do not think the designation "Garden Architect" is the correct one to apply to the members. It smacks oo much of the Continental usage, just as 'Landscape Engineer" is distinctively American. The good old English name, 'Landscape Gardener," is good enough for me, and I think it should be good enough for all the followers of Repton, Loudon, Brown, Paxton, Milner, and many others who have left their impress on the art and practice of landscape gardening, both in this country and elsewhere.

But my chief concern is with the constitution of the proposed Society. Who are to be admitted as members of it? Is it to be open to any adventurer who may come along to become a member of it, or is everyone to be entitled to attach the letters "M.S.G.A.," or something of this sort, to his name for advertising purposes without any distinction as to his qualifications? If so, the formation of the Society will be a huge mistake, for it will only be a trap for the unwary. There are many people who are masquerading as landscape gardeners who have neither the training, the education, nor the aptitude for the work to enable them to carry out any important scheme, and to class such individuals in the same category as those who have made the art a life study would be folly.

Sedum spathulifolium, a first-rate Stonecrop for clothing a rocky boulder

I know of a good many little jobbing gardeners who could not make a plan of a kail yard who exhibit on their signboards and in the headlines of their business paper and elsewhere such designations as "Landscape Gardener" or "Landscape Gardening in all its branches," and there are others who have had no training whatever, either in gardening or planning, such as sand, gravel, turf, timber, etc., merchants, some of whom are doing a considerable amount of work of this kind simply by advertising themselves in the Press and elsewhere. They may have no aptitude whatever for the work, and their sole object is to make money out of it. Now, my point is, Are individuals such as these to be admitted on the same footing as the skilled section of the Society? If so, it will be grossly unfair. But if there is to be grading of them, and each is to produce evidence of qualifications for admission, according to the grades, then the Society will carry some weight. But if not, who can expect the outstanding men in the profession to give a lead in the institution of such a Society, or who can expect the public who wish advice to have confidence in a Society of this sort unless the members are properly graded and designated?

SCOTTISH LANDSCAPE GARDENER.

Cutting back a newly-planted Yew hedge

The advice given to "Kent," issue December 1st, page 773, is contrary to instructions I have always had, which is, on no account to cut the "leaders" of a newly planted Yew hedge until they have attained the height required for the hedge, and from experience I have no doubt that it is a fatal thing to cut the leaders. A portion of a newly planted hedge here was topped by an amateur during the second year after planting. I intervened when he had got halfway. The result is plain to be seen, the topped portion is about 4 feet high and the untopped over 6 feet and much denser. My advice is to cut the sides only the third year after planting and leave the tops till the height required is slightly exceeded. You will then get a dense wind-protecting hedge.

MEILOR BRIDGMAN.

Horsted Keynes, Sussex.

Roscoeas from seed

I note you had an inquiry *re* seeds of Roscoeas in a recent issue. I got some of Roscoea cautleoides from Rev. J. Anderson, Glen Hall, Leicester, last year, and have raised several plants from the packet.

B. D. H. WATTERS.

55, *Church Crescent, Finchley.*

Roses—Single and semi-double varieties

THE taste for single blossoms is seen in various ways in gardening, that at one time would have received but scant consideration. One notices this in Asters, Chrysanthemums, and not the least in Roses, both in climbing and bush form. Speaking to a man in the trade some time ago about Roses to cover an arch, he recommended Hiawatha, that delightful crimson single, which is noted for the length of time it remains in flower, as well as for its great output. For supplying blossoms for table decoration the singles are becoming more popular every year, and one has only to think of the charm of such varieties as Isobel, whose carmine blossoms are so freely produced throughout the season; Dainty Bess, pink; Princess Mary, crimson scarlet; Irish Fireflame, orange and crimson; Innocence, pure white; and Mrs. Oakley Fisher, an orange yellow.

Single Rose Innocence

A creamy semi-double variety, not met with so frequently as it deserves, is Trier, blooming in huge sprays both early and late, and can be grown either as a bush or pillar. Lovers of Roses are now busy studying what additions they shall make to their collections, and I would bespeak a word for the singles, especially where they have not been tried. For an arch or pergola, such sorts as Paul's Carmine Pillar or American Pillar (a lovely shade of pink) will quickly cover any space desired, and no garden where Roses are grown to-day can be considered quite complete without some of these dainty forms.

LEAHURST.

Snowdrops: Their likes and dislikes

One of the finest displays ever brought to my notice was in a woodland at Markyate Cell, Hertfordshire. This is on the side of a hill and is of considerable extent. It is to be hoped that these wonderful masses are still to the fore (it is several years since I visited this delightful place). It is presumed that the initial planting was done by the monks, who in days long gone by inhabited the estate (hence the name The Cell, Markyate, the proper designation), and who were, as most people are aware, very keen and expert gardeners. That the Snowdrop thrives exceedingly there I can vouch for, and the soil, which is of no great depth, rests on pure chalk, so the Snowdrop does not object to lime.

It is interesting to know that Daffodils refused to thrive in this woodland, the lady and gentleman who owned the place at the time of my visit having gone to considerable trouble and expense endeavouring to establish a colony of these fine bulbous plants, but all to no purpose. The bulbs grew and flowered the first year, but afterwards gradually faded away.

Another fine colony of Snowdrops that came under my notice some years ago was at Carnel, Ayrshire, where the soil is a rather heavy loam. Unlike Markyate, the Daffodil thrives equally with the Snowdrop at Carnel, and also gives a wonderful display in its season.

C. BLAIR.

Preston House Gardens, Linlithgow.

Margyricarpus setosus

This is suitable for the rock garden where a plant of trailing habit is required. Few things make a more pleasing feature during the dreary season than a broad patch of this evergreen, free-growing plant hanging over a huge rock. The plant has no brilliant flowers to recommend it, but it produces large numbers of pretty white shining berries which nestle in the handsome yellowish foliage.

In congenial quarters it spreads into broad masses covering the face of a large rock with the richest verdure. The plant is not fastidious as to soil, any fairly light garden soil suiting it. The position must be well drained as stagnation is fatal to it.

The plant is increased by seed or cutting
It is hardy in well-drained sunny positio
but it is advisable to keep a few plants
pots for fear of loss during the wet season.

H. STEVENS.

Violets in frames

Special care must be given to Viol
growing in frames. In 1926 from Nove
ber onward to the spring of 1927 editors
gardening papers and nurserymen genera
were inundated with complaints and sam
plants more or less destroyed by fung
disease, mostly Cladesporium. The con
tions favourable to its development prevail
mostly in the south and west of Englar
where the rainfall is greater, Devon being
special sufferer. Now what are the con
tions precedent? A rather sunless year w
heavy rainfall finds the plants in the autu
in an unripened state. The moving of t
plants into frames, unless done very careful
arrests their growth. If added to this t
plants are kept too close, moving air is e
cluded, while the outside conditions a
muggy, the air being stagnant and hum
with moisture, and sunshine at infreque
intervals. You have all the factors prese
for the development and spread of fungo
trouble, and this is what happened in 1926

Forewarned is forearmed. In articles
wrote for GARDENING ILLUSTRATED in Se
tember I advocated growing Violets f
bloom in positions fully exposed to sunshin
Where this has been done the plants shou
be hard and well ripened, the flowerin
crowns ready to burst, and the liability
mildew much less. If the following hints a
observed there should be little fear of a r
currence of the epidemic of 1926. Remen
ber, little can be done to arrest it once th
plants are badly attacked, as it spreads wi
frightful rapidity. Prevention, therefore,
better than cure.

Air must be kept on continually during th
day. Watering should be stopped and hea

ain kept off. The soil should be stirred between the plants every week or two. De- ayed leaves and flowers should be picked off nd the plants kept clean.

Sturmer. F. E. Dillistone.

'iolet leaves for examination

(F. W.).—The leaves of Violets sent are iten by slugs and snails and other normal ermin; possibly, too, the fertilisers have ome in contact with the leaves. If ground infested with grubs Kamforite or Vaporite re useful to dig in when ground is vacant, ut a good dressing of soot while plants are rowing every few weeks will keep off slugs id snails.

When idols have feet of ——

NLY a small percentage of the myriad new plants introduced to our gardens are the unqualified success Press opinion and ırserymen's eulogies make them out to be. ot that they are all failures; rather, that iexpected or unmentioned "snags" attend ieir cultivation or mar their beauty.

Consider, for example, the much-boomed rimula Florindæ. It has its uses in the rge wild garden, for its cultivation is easy, s propagation from seed no less so; but any people frankly confess that they find a disappointment. It is admittedly coarse," and lacking in gracefulness; more an that, its flowers seem disproportionately ıll and small when compared with the aves and great stout stems. P. microdonta picola is a similar, but far superior, plant, a great extent free from these faults, and cking only a little of Florindæ's size. The tter, indeed, is a better plant in its first ason's flowering (from seed) than when oss with age.

Meconopsis Baileyi, or betonicifolia—if ese *are* synonyms, which has priority, ease, someone?—had at first every appear- ıce of justifying fully its praise, and, with- ıt doubt, it is, except for our own Welsh ppy, the easiest of the genus as yet known rticulturally. Its blooms have a size be- ted to its rather stately habit, and what atter if its perennation does depend on the parently arbitrary production or no of condary basal shoots, for it is readily ised from seed?

Meconopsis Baileyi in cool woodland

The almost inevitable fly has appeared in the ointment, however. Whisper it softly, awful news; that marvellous blue which from a single peerless blossom dazzled the Chelsea crowds two years ago is not to be relied upon; horrid dinges, slates, and purples may replace it, and are hailed, incidentally, by one writer as the delightful promise of an increased colour range!

No one would advocate a chilly rejection of all the greatnesses thrust upon us without full credentials, or a timorous if economical waiting for the impossibly flawless plant, since perfection is not only always out of reach, but a matter of personal opinion as well.

It is too much to hope that "truth in advertising" in the widest sense will ever invade our beloved catalogues to the extent of pointing out not only the virtues of plants, but also the vices which sooner or later manifest themselves, yet such a policy might well be best for everyone in the long run.

Clay.

Border Chrysanthemums that withstand the elements

The very best of these border flowers is Dick Barnes, with bright Burgundy-red flowers produced freely on open symmetrical sprays. This is one of the best decorative varieties to date, wind and rain having no effect on it. Should not be disbudded.

Belle Mauve.—A very old variety producing great masses of its delicate mauve-pink flowers on good stems. Should not be disbudded.

Bronze Early Buttercup.—If disbudded, this gives very large flowers, but, to my mind, the blooms grown naturally are far more beautiful, being of a bright, shiny, bronzy-orange shade. Unfortunately, the plant is a very tall grower.

Bronze Normandie.—Being a week or two later than the variety from which it sported, this lovely bronze variety need not be disbudded.

R. Pemberton.—Although one of the oldest varieties, yet in cultivation is still indispensable, its rich wine-red flowers being produced in profusion, and nothing less than a really hard frost has any effect on it. Should be grown in sprays. There is a very good blood-red sport from this, with all the good points of the parent.

Framfield Early White.—This is the only white that withstands wind and rain with impunity here. It is a very chaste and shapely flower, good either disbudded or grown naturally.

William Ritchie.—A primrose-yellow sport from the last-named, has every good point of the parent, while, if anything, the flowers are more shapely. C. Blair.

Preston House Gardens, Linlithgow.

The latest certificated Chrysanthemums

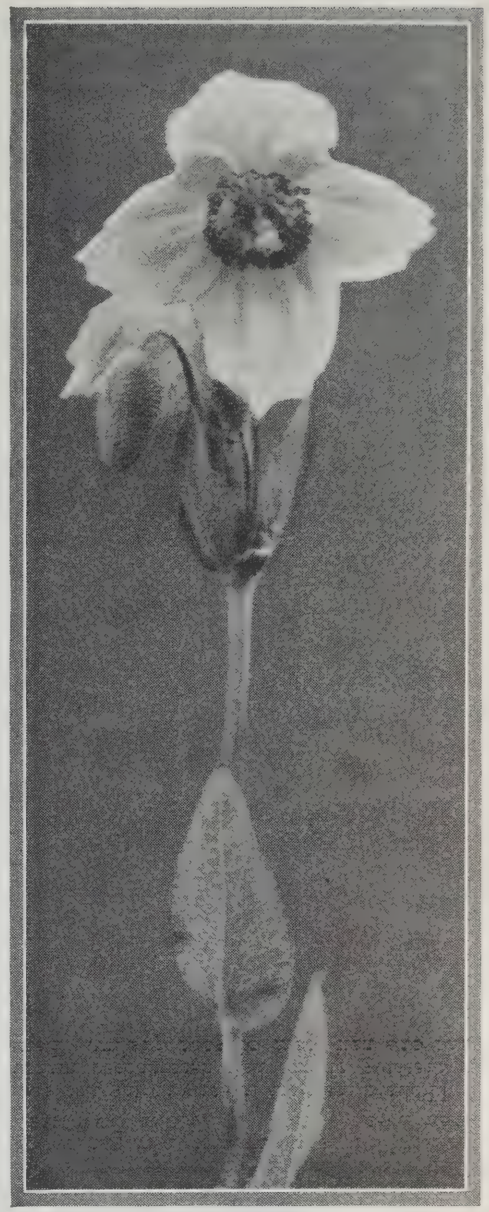
There were only three new Chrysanthemums shown at the last meeting of the current season of the Floral Committee of the National Chrysanthemum Society, held at Vincent Square, Westminster, on December 31st last, and two of these received recognition as follows:—

Bronze Conquest.—This is an attractive bronzy-yellow sport from the well-known mid-December Decorative variety, Conquest, and was shown flowering in useful sprays. There is also a variety known as Crimson Conquest. Commended. Shown by Mr. H. Woolman, Shirley, Birmingham.

New Year.—A very beautiful and attractive single-flowered variety having two rows of fairly broad florets evenly arranged and a comparatively small yellow disc, building a flower rather more than 4 inches across. Colour, orange-bronze with yellow zone round disc. Beautiful under artificial light and valued for its late flowering. First-class Certificate. Shown by Mr. H. Shoesmith, Junr., Mayford, near Woking, Surrey.

The Committee wished to see again a single variety named Rosabelle; colour, rose-pink.

D. B. Crane.



A noteworthy blue Poppy

Meconopsis Baileyi, one of the most beautiful flowers of recent introduction. The plant attains a height of about 3 feet. The flowers, which show a tendency to vary in colour tone, are usually clear blue-mauve with golden-coloured anthers

Drainage

Badly drained patches in the garden are now more noticeable than at any other period of the year. The work of draining these patches should be undertaken whenever possible. Such work should always precede any other improvements that are in view; to spend good money on badly drained land is unsound practice. No great improvement can be expected if at certain periods of the year water collects in the soil, fills all the interspaces, and drives the whole of the air out.

TREES AND SHRUBS

Grouping different kinds of trees

TREES widely different in their affinities, but having a resemblance to one another in the size and forms of their leaves, may be associated in groups. Mixture of kinds, however, is most commendable when the trees posesss some other marked characteristic in common, such as colour of foliage, bark, and flowers, and habit of growth or form. Thus, when depth or darkness of colour in leafage is desired, fit associates exist in the Purple Beeches, Prunus Pissardi, Oaks, Elms, Hazels, and Barberries. Where light colours are wanted they are at command in the Corstorphine Plane, the Golden Oak (Quercus pedunculata Concordia), Golden Ash, Birch, Alder, and Elder, as well as in the Gold and Silver Yews, Moonlight Holly, Spruces, and the smaller Coniferæ; as also among the naturally silvery foliaged trees, such as the Abele Poplar, the Huntingdon, and some other Willows; the Whitebeam or Service Tree, and Sea Buckthorn; while among strictly variegated trees and shrubs there exists a wide field to select from. The autumnal colours and tints of fading foliage deserve marked attention at the hands of planters for ornamental effect. And whether the rich scarlets and purples of our native Geans, and of some American Oaks, the golden yellow of the Norway Maple, or whatever colours are wanted in plants that have been grown from seed, it is a wise precaution to select them in the nursery, when the colours are most marked, as the fading leafage of plants raised from seed is generally much varied, although these be of the same species or kind. Colour in bark is most appreciated when the branches are denuded of their foliage; and small or moderately-sized groups, having distinct colours, tend to break up or relieve that dull monotony which prevails in deciduous woodland scenery throughout the winter and early spring. The following may be instanced: With white or lightish coloured bark, the common and several other kinds of Birch, Constantinople Hazel, Snake-barked Maple, the Cane or White Welsh Willow (Salix decipiens), Cratægus punctata, and some other Hawthorns; with yellow or orange-coloured bark, the yellow-barked small and large-leaved Limes, Golden Ash, Golden and Copper Willows; and with reddish, dark, or blackish bark, the red-twigged or Coral Lime, Salix acutifolia, S. daphnoides, S. purpurea, S. nigra, and some other Willows, Cratægus M'Nabiana, and several other Hawthorns, and the Red Dogwoods. With regard to flowers, although the Horse Chestnut and the Gean are the only full or large-sized forest trees that produce showy blossoms, there are of smaller trees the Pavias, and other allies of the former; while belonging to the same natural order as the latter, there are others of the Cherry tribe, Hawthorns, Services, Mountain Ashes, Mespiluses, Almonds, and the wild forms of the Apple, Pear, and Plum. In other families there are the Scotch and English Laburnums, Robinias, Lilacs, and Elders, which, together with Rhododendrons, Azaleas, Weigelas, and other flowering shrubs too numerous to mention, are admirably adapted, when grouped according to their colours, for decorating the margin as well as the interior of our woodlands. And on prominent rocky points, natural sites for
the Rowan, the Gean, and the Sloe-tho
the snowy whiteness of the last two displa
before the earliest leafage of spring is e
the admiration of all beholders. Of disti
habited trees, drooping or weeping kinds
very serviceable for shutting out lower
near at hand unsightly objects, without i
peding the views of more distant and imp
tant scenery. In such a case, weeping tr
being comparatively few, a judicious mixt
of kinds becomes necessary in order to
viate disagreeable monotony and uniform
This suggests a procedure that is too ge
rally neglected in opening up views that h
become interrupted or shut out by the o
growth of injudiciously planted trees,
that of grafting some of these with weep
kinds at requisite heights, particularly As
and Elms, which are the most ea
operated upon; and the more general ad
tion of this practice would be the means
retaining many a fine stem or bole, wh
their presence is ornamental as well as ne
ful. Among upright, pyramidal, and coni
formed trees, we have the Lombardy Po
as the most important, from the great hei
to which it attains as well as from the
markably fastigiate upright habit of
growth, characteristics which render it hig
suitable for certain localities, but most
congruous in others. Thus, when neither
thickly nor over-widely grouped at the e
of a bridge, viaduct, or high-level top
embankment, these horizontal lines are,
it were, balanced and supported by the
pendicular lines of the Poplars, and the la
have a singularly important landscape ef
when seen rising from among ordin
plantations over these horizontal surfa
as well as over flattish-topped ranges
buildings, while, among or rising
hind groups of roundish-headed tr
their occasional presence has a very pleas
effect. On higher, drier, and more expo
grounds, some of the taller growing coni
topped conifers, such as the Silver Fir,

Practically all of these have disappeared. This city is thus kept as an historical curiosity. The fortified areas are in many cases converted into parks

Cornus canadensis

general favourite with nearly all who cultivated it, the neat little Cornus cana- is deserves a little more appreciation than enerally receives from those who know about it. It does not make a special al to those who love flamboyant colour- Its floral charms are of a more modest , but the small flowers are surrounded conspicuous white bracts, and the pretty es are exquisitely coloured in autumn with ous bright hues, which give much de- t to the cultivator. It is of spreading t, and soon creates a mat of foliage when y, which it generally is when planted soil of loam with a good proportion of soil and sand added, and when planted ade, partial or entire. As may be antici- d, this Canadian Dogwood is perfectly y. It is increased by division of good- l plants or by seeds, when these are inable. S. A.

The Kentucky Coffee Tree

e decision to plant trees of various kinds g some of our new roads is a very happy and it is to be hoped that a wise selec- will be made. There are several of the trees that do well in this country might be tried, and among them the e-named, botanically known as Gymno- us canadensis, as it is a shapely tree of um size with light, graceful foliage. I rather a strange experience with one of trees at a place where I was then living. ad attained a height of 38 feet and was g away well when it came down in a and, being only about 12 feet from a bouring wall and falling on the same, pper part snapped off, whilst the lower was kept from falling right down by wall, and it was only partially uprooted. s about to clear it away when I noticed ng growth coming away from the main some 6 feet from the base, about the in length, and as straight as a gun- l, so instead of destroying the tree I d the broken edges off at an acute angle plastered the wound, then excavated the soil well underneath, and hauled the tree back to its former position, or nearly so, there still being several of the roots at the sides left practically intact. I do not know how it has since fared, but when I left the place the shoot was about 10 feet long, strong and healthy, and apparently on its way to make another shapely tree. Returning to the subject of exotic trees suitable for planting by the sides of our new roads, others that might find a place would be Ailanthus glandulosa (the Tree of Heaven) and Pyrus sorbus pyriformis (the Pear-shaped service), as both make very shapely, handsome trees of upright growth with beautiful foliage. The only objection to the Service Trees would possibly be the small fruits, which in some seasons are produced in great profusion and would make rather a mess of the ground beneath. E. Burrell.

Hardwick.

Hydrangea paniculata grandiflora

This hardy autumn-flowering deciduous shrub is an invaluable subject for massing or growing in groups. It is, undoubtedly, the most showy of all the Hydrangeas with the exception of H. hortensis, which, of course, is not hardy in all localities. The typical form, Hydrangea paniculata, attains to a height of a small tree or large shrub in its native countries, China and Japan. The variety under notice, H. paniculata grandiflora, was introduced from Japan nearly 60 years ago. It will grow and flourish in most parts of Britain, where it usually forms a shrub a few feet high. When liberally treated the flowers are produced in enormous panicles, forming closely packed pyramids of bloom from August to October. The colour of the flowers is a greenish-yellow on opening, changing to pure white, which later turn to purplish-pink and finally brown. Newly all the flowers are sterile.

This plant likes a cool, rich, loamy soil, and responds to a liberal dressing of well-rotted manure applied each season during the early spring. It is advisable to plant where the soil is not liable to become dry in the summer if the best results are desired. It can be grown and treated in the ordinary course, with little or no pruning, but treated in this manner the panicles of bloom will be smaller, though none the less elegant and pleasing. If, on the other hand, large panicles are desired hard pruning and thinning out of the shoots must be resorted to. These should be cut hard back in the spring before growth commences, limiting the shoots in proportion to the size of the plants. By adopting this method large panicles of blossom may be obtained 18 inches in length. It should be noted, however, that very hard pruning over a prolonged period has a tendency to shorten the life of the plants. As previously stated, it is invaluable for growing in masses or planting in groups under standard trees, and it is one of the best of autumn-flowering shrubs. J. Lodge.

Dutch enterprise in park making: Showing the conversion of an old city moat to a park

Typical sand dune country

This is converted into pleasant woodland for public parks by planting the shifting sands and encouraging natural growth in the areas thus protected

Dutch enterprise in park making

By Hugh E. Seaton.

DUTCH town-planning and park-making includes characteristic features very novel to us in England. The old moated cities with their intricate defences of wall and water have presented a splendid opportunity for developing a park ring round the densely built areas. This has been done by levelling and planting the ramparts while leaving part of the waterways to form a delightful series of ornamental canals and lakes.

Practically all these old fortifications have disappeared before modern progress, the city (illustrated by air photograph) being one kept intact for historical reasons. This large use of water in Dutch parks is very typical, and something which we in England seldom can afford to imitate, but its effectiveness is worth keeping in mind for cases where conditions may allow such treatment.

Another dominant phase of the Dutch landscape is the vast area of sand dunes. The shifting sands have been a menace and a problem.

The problem has been solved by strategic planting of the mounds, which has checked movement and formed sheltered spaces in which natural vegetation can grow.

These plantation-developed areas have become delightful natural parks and playgrounds, a species of extensive "Hampstead Heaths" open for the healthy recreation of the people.

Being so near water-level, patches of this dune country are actually under water, and form, after planting, beautiful woodland lakes.

The illustrations, obtained by courtesy of the Director of Parks of The Hague, convey better than any words the results of Dutch enterprise in park-making.

Improving heavy soils

Soils that are known to be heavy, such for instance where clay abounds, may be improved during the winter months as opportunity offers, by rough digging and working in road scrappings, leaves, and decayed vegetable refuse. It is a job that too often is put off, but if only a portion of the garden is done, the advantage will be seen another year. Lime, too, is useful for breaking up heavy ground. Stone lime left on the soil and exposed for a day or two will soon "crumble" down, and can then be spread about. It is particularly valuable on ground which has been occupied with cabbage and winter greens, and will help to exterminate insect pests. W. F.

Why not a Primula house

Why not indeed? Scattered up and
this green little, tight little island of
sheltering beneath cottage walls in the
expanse of the open country, standing
and bold in the fenced plots of

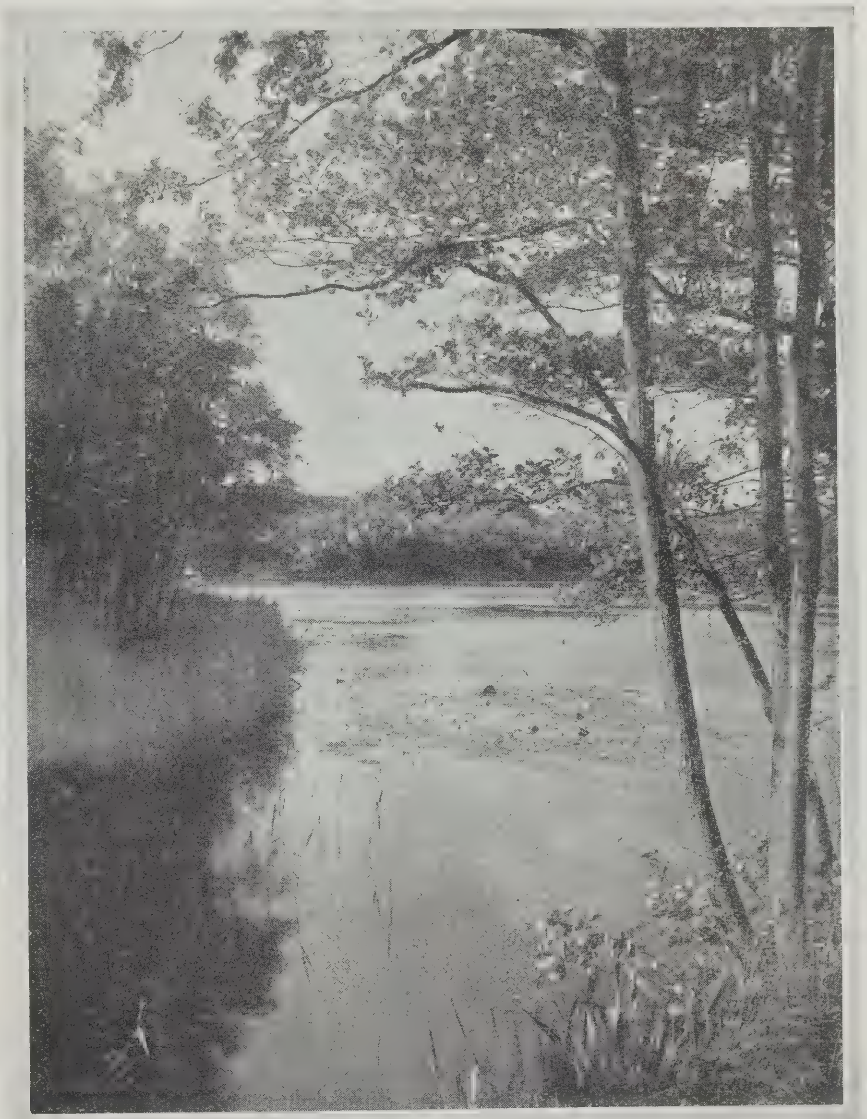
FRUIT GARDEN

The "best" Peach

AVING had experience in the cultivation of Peaches, under glass and on south walls, I am not infrequently asked intending planters: "What is the best ch?" On such occasions, I am afraid, f I may use the word) "hedge," by say- that Royal George is, unquestionably, best all-round Peach for general pur- es. Few, I think, will differ from me— variety is one of the best under almost y conditions save that, in a damp climate, al George is predisposed to mildew. Yet, ecommending this Peach, I do violence to own private opinion because, as a matter fact, there are two varieties which hold almost equal place in my estimation as "best" Peach. One of these is Walton Admirable, a really delicious Peach in ry respect—size, flavour, and colouring ng almost unsurpassable. Yet to the inary grower I would hesitate to recom- nd it because it is a shy bearer and de- nds unremitting attention. The other is lesse. This is also a magnificent variety, t I hesitate to recommend it because its our does not appeal to the average grower of Peaches. The fruits are very pale where shaded, but the skin is delicately streaked with red next the sun, while the flesh also is yellowish with a flush of red near the stone. I am rather at a loss to understand why high colour should be such a desideratum in a Peach. Doubtless ruddy fruits are more effective in the dessert, but, after all, the skin is removed before the fruit is consumed and, methinks, as in other cases, the beauty of the highly coloured Peach is only skin deep. The variety, raised by Rivers, Alexandra Noblesse, is almost equally good and is very hardy. These Peaches I consider to be the very best, followed, perhaps, by Raymackers, which is one of the largest varieties, rather after the style of Noblesse, but more highly coloured. Still, as I have said, Royal George is the best "all-round" Peach—not of the largest size, but a good grower which fruits abundantly and which has both appearance and quality in its fruits.

A SCOTTISH GARDENER.



Conversion of dune country

Natural lake made beautiful by encouragement of growth of trees

Reversion in Black Currants

I have on several occasions been asked by cottage gardeners to look at their Black Currant bushes to see if I could tell them what was wrong and what remedy to adopt. The bushes, they said, seemed to be quite healthy, but they failed to yield any fruit; they flowered freely, but as soon as the tiny berries began to swell they dropped off.

On examination I at once saw the bushes were affected with reversion, and advised the owners to dig them up and burn them, root and branch, as it was worse than useless retaining them, there being no known cure for the disease. From observation during the past 10 years I am inclined to think this trouble is more prevalent amongst Black Currants than we are aware of. Unlike the "Big Bud" disease, which is easily noticed, the round, swollen buds, showing up very prominently, reversion is not so easily detected, and so may, especially with inexperienced growers, go on for years, and during all the time the bushes are barren as far as fruit-bearing is concerned, but yet all the time the disease is spreading. I am told that it can be, and is, conveyed from an affected bush to a healthy one by the pruning-knife. Now, I am not scientific enough to say whether or not this is really the case, but I have observed in rows of bushes that the trouble did not appear in isolated plants, but invariably two or three bushes adjoining were affected. Whether this proves the theory of the knife carrying the disease or merely that it is contagious had better be left to the more scientific to decide. All the same, it is a disease which threatens serious consequences to this most useful fruit, and it is to be hoped those in authority will take the matter in hand and devise means of combating it.

Cupar, Fife. ALBYN.

REMINDERS FOR THE WEEK

Southern and Midland

The flower garden

An important business in many gardens is the annual pruning and thinning of climbing plants, such as Roses, Vines, Jessamines, Horse Briar, Rubus, Escallonia, Actinidia, and a whole series of graceful and extremely beautiful subjects, most of which may now be dealt with. These mostly require careful thinning, well-ripened shoots being used where extensions are necessary and shortening back of undesirable growths to within six or seven buds of their base. The Wistaria is a case in point, and when its branches have furnished their allotted space the only pruning necessary is that of cutting back the long, streaming growths of the past year to within five or six eyes of their base.

Roses

Although much planting still remains to be done, it should never be attempted when the soil is in a wet, sticky condition, and on heavy soils re-establishment is assisted if a little sand is shaken round the roots when planting. On all favourable occasions it is advisable to proceed with such work, and where—as in my own case—the ground beneath is carpeted with other dwarf plants it enables many of these to be got in, and the bed therefore completed for the season.

Protecting hardy and other flowers

Where not already done such precious plants as Romneya Coulteri, Convolvulus mauritanicus, Sparaxis (the Wand Flower), Sweet Verbena, and similar favourites should be given some kind of protection, such as a pile of ashes around the crowns, or a little straw or Bracken pressed about them. The protection of perfectly hardy flowers is against our enemy, the slug, and many lose their plants through the crowns having been eaten out whilst beneath the surface. This applies to Delphiniums, particularly Gypsophila paniculata, Platycodon, and various succulent Harebells, both in the flower and rock garden. A mound of coke or coal ashes placed over their crowns will save them; the surface should, however, be made loose and rough from time to time.

Salads in frames

Examine these frequently and remove decaying foliage, stir up the soil frequently, dust a little soot among the plants occasionally to check slugs, and air freely when the weather is favourable.

Roots of Chicory, Rhubarb, Seakale, and Dandelion

These should be placed in a warm, dark room every 10 days or so in order to keep up a constant supply of blanched heads. A temperature of 50 degs. to 55 degs. is desirable.

Digging, trenching, and draining

This work is constant from the present date, and vacant plots requiring the latter attention should be dealt with first, the drains being laid 3 feet deep so as not to be disturbed when such ground is being trenched in future years. By covering over the surface beforehand with manure, leaves, etc., digging may be proceeded with, even when the surrounding ground is hard caked with frost.

Broccoli

These have a habit of turning in at times when least expected, and it is advisable to examine the lines from time to time and protect such as are showing their flower.

Chives and Mint

Lift and place in boxes a few roots of these at intervals and stand in a warm house, such being much appreciated.

Chrysanthemums

Cuttings of those required for large blooms should be secured when about 3 inches high, and if such cuttings are attacked by Green Fly—as so often is the case—they should be immersed in a mixture of Quassia Extract before being placed in the cool propagating frame. It is usual to insert such cuttings singly in small pots, but excellent results are obtained by placing three or four in 3-inch pots, and a great saving of precious room. Sharp, sandy soil should in every case be used and the base of the cutting made very firm.

Indoor Peaches

After cleaning the houses of early kinds the trees must be pruned and cleaned, walls lime-washed, and after being thoroughly cleansed the trees must be carefully tied back in their place. It is a foolish policy to overcrowd such trees at any time, and if the winter pruning is carefully carried out much of this will be avoided. The actual fruiting branches should be at least 5 inches apart when the trees are tied out.

Flowering houses and conservatories

Containing as they do a large proportion of plants actually in bloom, it is very unwise to force up hot, dry temperatures during frosty spells, as this is ruinous to fully expanded blooms, therefore maintain a degree sufficient only to dispel frost on such occasions, and on mild occasions 55 degs. at night is ample in such houses. E. MARKHAM.

Gravetye Manor,
East Grinstead, Sussex.

Scotland

Carnation cuttings

During the next week or two cuttings of the Perpetual-flowering Carnation should be secured. Sturdy side shoots make the best cuttings, and should be firmly inserted round the edges of 3-inch pots. The compost should have a liberal allowance of silver sand. As soon as the cuttings are got in give a good soaking of water and then plunge in gentle bottom heat. Strong heat must be avoided, being both unnecessary and dangerous.

Pot-Roses

If not already done, these should now be pruned and set in a cool house or pit. Should top-dressing have been overlooked in autumn this, too, may be carried out now, using the best procurable turfy loam, a little leaf-mould and some coarse sand. A dessert-spoonful of Thomson's Plant Manure to each plant in a 9-inch pot will be found most beneficial. It should be evenly sprinkled round the plants and covered with a little of the compost. Make all very firm and give a good watering when the work is finished.

Seedling Cyclamens

Plants raised in autumn and which are still in the seed-pans and growing in a fairly warm house or pit should be moved to another house with a somewhat lower temperature, this plant, after the initial stages, being better when grown in a moderate but genial warmth. Three or four weeks later they should be pricked off into 2-inch pots and be kept moving steadily, but not too rapidly, all along.

Raising Begonias and Gloxinias

If seeds of these two fine subjects be sown now and given decent treatment they will
bloom well in late summer and autumn.
the earlier stages both are treated alike.
preparing of the seed-pans requires a
deal of care, the surface having to be
very level and smooth. It is well, als
thoroughly moisten the soil in the pan
fore sowing. The best method for doing
is to plunge to the rim in a bucket of
for a minute or two. On removal from
water allow to stand and drain for a c
of hours. Scatter the seeds as thinly
evenly as possible and just sprinkle a pin
fine silver sand all over the surface. T
all the covering necessary. Cover each
with a piece of glass and a sheet of p
and set in a moist, genial warmth of
70 degs.

Chrysanthemum cuttings

All the " singles " and " decoratives "
now be propagated as cuttings become
able. Although roots will form more ra
if bottom heat be given, it is much bette
the future plant if it be rooted in a coo
or greenhouse. These cuttings, as a
wilt a little when so treated, but with
thing like decent handling the great maj
will root and grow into fine plants.

Begonia Gloire de Lorraine

The flowering period of these is well
so the plants should be cut back so that
may be able to throw up fresh, st
growths fit for cuttings. Do not over-
for a time, but spray overhead daily
clean, tepid water. A temperature o
degs. or so suits at this stage.

Pruning fruit trees and bushes

Any arrears of pruning should be see
as soon as convenient. It is a cold and
agreeable business at any time, but du
really cold weather it is hardly possibl
carry it on. It should, therefore, be atte
to as soon as a mild spell comes along.
prunings should be gathered up and bu
and thus destroy many injurious insects
their eggs, while the ash, if kept dr
valuable for many garden purposes.

Raising Onions

Even if only grown for home use it is
to raise a few plants of this valuable
table early, for by so doing the crop
frequently escapes the dreaded grub.
less intended for competition there is no
necessity for pricking off the little plants
other boxes, as quite good results are
by transferring direct from the seed-bo
their permanent quarters. The boxes
should be $4\frac{1}{2}$ inches deep and filled with g
fresh compost. Sow the seeds as thinly
evenly as possible, and cover to the dept
about $\frac{1}{8}$ inch. Let in a genial tempera
of 60 degs. to 65 degs., and as soon as gr
appears get the boxes raised up quite
to the roof-glass.

To secure large Leeks

The seeds may be sown and treated in
initial stages in the same way as adv
above for Onions, but the little plants
be pricked off when about 2 inches to 3 in
high into other boxes of rich soil, gr
steadily on, and eventually planted ou
richly prepared trenches when fear of
is past.

Cauliflowers in frames

In open weather admit abundance of
to the frames where these are winter

VEGETABLES

The cultivation of large Onions

TO grow large Onions approximating
2 lbs. and upwards a start should be
made early in January. The seeds
ould be sown in boxes in a compost con-
ting of fibrous loam, leaf-soil, and old de-
yed manure, with sufficient sand to make
e whole porous. This should be passed
rough a ¼-inch meshed sieve. The boxes
ould be filled with the compost to within
inch of the top and made firm. The seeds
ould be distributed thinly and evenly on the
rface and only just covered. After sow-
g, the boxes should then be placed in gentle
at under glass in a temperature of about
degs. and kept shaded until germination
kes place. When the young plants appear
ey should be gradually exposed to the light
d placed near to the glass. As soon as the
nts are large enough they should be
icked off into boxes 3 inches apart in a
ghtly rougher mixture of a compost to that
commended above, to which a little bone-
al may be added. The soil must again
made firm. The plants should now be
own on in a temperature of 55 degs. to 60
gs., still keeping them near the glass, and
ringing them frequently during the day
th tepid water. It is also advisable to stir
e soil occasionally in the boxes with a label
pointed stick in order to aerate the soil
d promote growth. About the middle of
arch the young plants should be gradually
rdened off, transferring them to a cold
me towards the end of the month. Later
they can be stood outside preparatory to
anting out in the open, usually from the
iddle to the end of April, according to
eather conditions. The young plants
ould never be allowed to suffer from lack
moisture at the roots.

The site on which it is intended to grow
e Onions should be liberally treated, the
ound prepared by trenching and manuring
ring the autumn and winter months.
ght soils are preferably trenched in the
tumn and strong, retentive soils in
bruary. Onions need a rich soil, and it is
rdly worth the trouble of raising plants
der glass if the after-cultivation is
glected. When trenching the ground a
eral quantity of farmyard manure should
worked into the layers as the work pro-
eds. The ground can be left rough and
mpy until spring; the weather during the
nter months will sweeten and pulverise the
il, which can then be brought to a fine
th at planting time. When planting-out
ne arrives the ground should be levelled
d raked down fine. When the young
nts are ready for putting out they should
lifted from the boxes with a hand-fork or
rden trowel, retaining as much soil as
ssible. The operation of planting out is
st carried out with a garden trowel, allow-
g a distance of 15 inches between the rows
d 9 inches to 12 inches between the plants.
ey should be planted firmly. Frequent
mping or syringing overhead is very bene-
fial to the young plants when first put out.
e soil between the rows should be fre-
ently stirred with a Dutch hoe and kept
e from weeds. Light applications of some
proved fertiliser and soot scattered between
e rows at intervals and hoed in will be
nd of great assistance to the plants after
ey have commenced to bulb. Towards the
d of August or the beginning of Septem-
r the crop will be ready for lifting. Be-
e storing away the bulbs should be
oroughly ripened off.

Undoubtedly, the best variety to grow for
ge bulbs is a good strain of Ailsa Craig.
e illustration herewith depicts this variety.

A remarkably fine bed of Onion Selected Ailsa Craig

Notes on some of the newer varieties of Potatoes

THE following notes on some of the newer varieties of Potatoes may be of interest to the readers of this journal. All varieties have been tested for two years, except Arran Banner, and all have received exactly the same treatment. The soil is a typical Potato one, and always produces excellent crops of all the standard varieties, such as Kerr's Pink, Great Scot, Majestic, and Arran Chief.

ARRAN BANNER (Immune Maincrop).—This is the most outstanding variety that I have grown since Arran Chief was introduced. It has a strong distinctive haulm. The tubers are round, with white skin and white flesh, and the eyes are of medium depth. It is an enormous cropper, and the cooking qualities excellent. This is a variety with a great future. I am not judging it solely on my own trials. I have seen it lifted in various parts, and I am confident that it will be largely grown in the near future. We have had so many poor varieties introduced during the past few years that it is a great pleasure to find such a promising variety on the market. It has, with me, eclipsed all varieties for weight of crop, such as Kerr's Pink and Majestic. No new variety has done this since these two varieties were introduced. Potato enthusiasts who are on the look out for a "good thing" should keep their "eye" on Arran Banner.

ARRAN CONSUL.—Although this variety was highly spoken of, I have yet to lift a good crop. For three years it has been very disappointing with me. The tubers are oblong, and on strong land the "eyes" are deep. The skin is white and the flesh white. This year it has suffered severely from blight, and there has also been a good deal of "second growth." It is, however, a good cooker, and it also keeps well.

DUKE OF PERTH (Immune Maincrop).—This is another disappointing variety. Last year the crop was poor, this year it is not much better. It seems rather susceptible to blight. The tubers are oval in shape, with shallow eyes and white skin and flesh. It is quite a nice Potato, but a poor cropper.

SEFTON WONDER (Immune Maincrop).—During the three seasons that this variety has been under trial it has given most excellent crops of even-sized tubers of good quality. It is identical with Great Scot, except in the skin, which is a russety-brown. It is quite a nice tuber, and makes a good dish in a collection for the show bench. I like this Potato very much, but whether it will ever become popular remains to be seen. Perhaps many people will object to the colour.

GLASGOW FAVOURITE (Immune Maincrop).—So far this variety has done remarkably well. It is a heavy cropper and good cooker. The tubers are round to oval, eyes shallow, skin white, and flesh white. The haulm is strong and vigorous. This variety is well worth a trial.

PERTH FAVOURITE (Immune Maincrop).—This one has been very disappointing. It has produced light crops for two seasons, and a large percentage of "chats." The tubers are round, rather flat, with eyes of a medium depth. It is a good cooker.

HERALD (Immune Early).—One of the best early immunes that has been introduced for a long time. It gave a most excellent crop in 1927, and almost as good this year. The tubers resemble Majestic, the eyes are shallow, and it has a very fine, white skin. It is not so early as Epicure, or Duke of York, but is a heavy cropper, and produces very few "chats." It makes an excellent exhibition tuber. In the early part of the season it cooks rather soft and watery, but improves as the season advances. I have no hesitation in recommending this variety for trial.

"SOLWAY FIRTH."

Forcing Dwarf Beans

An early dish or two of this popular vegetable is always appreciated, so where suitable accommodation is available a start should now be made. Use clean, well-drained 7-inch or 8-inch pots, the compost to be a light, rich, and open one. Fill the pots only about three-quarters full and so allow space for future top-dressings of rich soil. Plant nearly a dozen seeds in each pot, but pull out about half of the resulting plants should all grow. Set in a moist, genial atmosphere.

Answers to Queries

Queries—*Queries and answers are inserted in* Gardening Illustrated *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* Editor *of* Gardening Illustrated, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* Publisher. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* Gardening Illustrated *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

TREES AND SHRUBS

Hydrangea paniculata

A number of these plants have been for years in a bed of rather light soil. Although pruned they throw out very little new growth and are poor, leggy specimens. When is the best time for pruning? Would they like manure? What could be planted to cover the bed under their rather bare and spindly branches? I tried Phacelia, but the bed is in too shady a position. S. M. M.

Co. Cork.

[The best time at which to prune Hydrangea paniculata is immediately after the flowering season, cutting the flowering shoots back to a couple of buds from their base. The fault is obviously in your light soil. Hydrangeas to do well ought to have a rich medium. Try working in some good leaf-mould among the roots, and, in addition, a mulch of well-decayed manure would be of much service, although the latter would interfere with your intention to carpet the surface with dwarf plants. This, for a season, might be omitted, but if plants are desired Violas would be most likely to give satisfaction. Hydrangea paniculata, like all members of the family, is rather a thirsty subject and ought never to be allowed to become at all dry. Watering with liquid-manure or with a good fertiliser in solution might prove a good substitute for mulching, and would permit of Violas being used.]

Ceanothus Gloire de Versailles

When can this be cut back? I read in your issue of December 22nd that it can be cut back hard, but no mention of time of year to do this. I have a very much overgrown bush of this in a shrubbery and am anxious to treat it properly. S. M. M.

Co. Cork.

[Any pruning which this plant may need ought to be undertaken immediately after the flowering season, cutting the shoots back to the desired length. If this was neglected at the time indicated the thinning may be lightly done, as a temporary measure, in April, and after the ensuing flowering season the plant can be more effectively dealt with. You are fortunate in being able to grow C. Gloire de Versailles as a "bush" in the shrubbery.]

Tulip trees dying

In a part of the grounds once called the Pleasaunce are some rather fine old Tulip trees upwards of 150 years of age. The curiously large round bowl-shaped bases from which the trunks start are beginning to decay by the ground, and the top branches are gradually becoming more leafless every year. Shall I be likely to save these trees by cutting down to, say, 15 feet or 20 feet from the ground, thus inducing the growth of a pollard? I fancy by this I might prolong their lives. Home Counties.

[Pollard the trees in early spring and apply a dressing of one half decomposed manure and one half loam of good quality. Better still, carefully remove, by scraping out from between the roots, all the old and spent soil, substituting that recommended above instead. In pruning off the branches cut at a good angle, so that the rain may easily run off, pare the edges of the wounds, and apply a coating of either paint or tar.]

Eurya latifolia variegata

I should be obliged if I could have a few hints as to the best time of year for, and method of, propagating Eurya latifolia variegata, of which I possess a good plant full of nice, healthy growth. W. S.

Ealing.

[This plant may be easily propagated by means of cuttings taken either in spring or in late autumn. In the former case select shoots 3 inches in length of the young growths, and, if possible, place them in a propagating case in which they will receive a moderate bottom heat, keeping them close until roots are formed. Should this means not be suitable take cuttings of half-ripened wood in September, insert them in sandy soil, and place in a greenhouse or in a cold frame, covering the cutting-pan with a sheet of glass till roots are emitted. Afterwards routine treatment, as in the case of your old plant, is all that is necessary.]

GREENHOUSE

Gardenias

Can you tell me why my Gardenias are not thriving? The leaves came in all white, so I pruned the plants hard back after re-potting them in good soil and leaf-mould. They are shooting out leaves, but they are again coming white. Can you tell me the reason and what I can do to get the leaves green? The plants are in the Orchid-house with temperature up to 65 degs. to 70 degs. I have had the plants some years and have taken cuttings every year, and they did very well for several years. Do they require peat? Also can you recommend a greenhouse heater for small greenhouse? I have an oil lamp heater. Would this do, or are the oil fumes injurious to the plants? In the greenhouse are two climbing Roses (a Maréchal Niel and a Nephytos) and a Plumbago growing, and various plants in pots. C. T.

[It is pleasant to reply to a query in connection with Gardenias, which are not now very widely grown. Assuming that the paleness of foliage, which is referred to, exists only in the young shoots no alarm need be felt; the lack of light is responsible, and the trouble will pass away as the days lengthen. It is not unusual to find Gardenias, Camellias, and similar plants behaving in this manner during the winter months. If, however, the trouble is general on old and young wood alike, it is probable that the plants are growing in exhausted soil and that repotting is necessary. An excellent compost for Gardenias consists of two parts sound loam, one part peat, a small quantity of bone-meal, and sufficient silver sand to make the whole porous. Pot very firmly and water cautiously for a time. As to y
other query. The fumes emitted by an
lamp heater are deleterious to plant grow
not deadly, perhaps, but certainly object
able. There are usually advertisements d
ing with inexpensive and effective hea
plants in Gardening Illustrated. By
sulting the advertisement columns you
no doubt, find a suitable and econom
apparatus.]

Cyclamens with small blooms

Can you tell me why my Cyclamen flov
are very small this year? The plants
healthy and full of bloom. They
brought on slowly in a warm greenhouse
Mrs. H.

[If the plants are, as you say, healthy
full of bloom, the only reasonable expl
tion of the smallness of flower is that
plants are getting old, or that, possibly,
have not been repotted before being star
Try the effects of a top-dressing of light
fairly rich soil, combined with occasi
waterings of weak soot-water. Young pl
of Cyclamens are always much more s
factory than old ones if large indivi
blooms be desired, and as they are ea
raised from seeds fresh plants could alw
be available.]

ROSES

Treatment of Rose

The climbing Rose (Bouquet d'Or) on
roof in my greenhouse has made great gro
and requires training afresh. How shoul
be treated as regards the new growth?
"Critic.

[In a case such as is described the Rose
the roof of greenhouse ought to be drastic
handled. Cut out, at once, the greater
of the strong green shoots, retaining me
as many as may be required to furnish
roof thinly. Prune all fore wood, or
growths, back to two eyes from the m
stems. Do not be afraid to handle the R
rather severely. Obviously the root-actio
right, and in a short time, even should
plant appear to be rather a skeleton, the
will furnish. When shoots are too num
ous, and if thinning be not thoroughly do
attacks of aphides and of mildew may
likely. See that the roots are kept well s
plied with moisture, but, in view of
strong growths, stimulants are not rec
mended.]

CHRYSANTHEMUMS

Border Chrysanthemums

(Mrs. H. H.).—There are now so m
varieties of excellent border Chrysant
mums that to make a selection or to rec
mend varieties is a difficult task. Heig
too, as well as season of flowering, vary
siderably. It is suggested that you
Woolmans, Shirley, Birmingham, to send
their catalogue, in which you will find colo
height, and time of flowering clearly gi
and from which a selection could be ma
Your heavy soil might be lightened
preciably by the use of leaf-mould instead
manure, and the time for planting bor
Chrysanthemums is during late April a
early May.

FLOWER GARDEN

Diseased Cheiranthus Allionii

(L. B.).—The specimens are decayed
badly for us to be definite as to the cause
death. When the disease has developed
such an extent there are so many soil org
isms present that it is impossible to isol
the actual cause of death. We think that
foot rot is the probable cause, and, if so, yo
best plan will be to take up and burn
affected plants and to give the others a so

with a solution of Cheshunt compound. the other hand, the whole of the root-tems are rotted away, and this could have n caused by over-manuring with an arti-al manure, but we do not think it would likely to occur if farmyard manure only s applied. We are sorry that we cannot more definite, but with the material to d this is the best we can do. Cheiranthus onii loves lime. Are you sure that there plenty in the soil in which you are trying grow them? If there is anything in a ne, Sandgate does not suggest that there much natural chalk about in your soil.

rolas and Chimaphilas

s I wish to grow the various Pyrolas and imaphilas which grow here (New West-nster, B.C.) locally I would ask your ad- as to their propagation. Their long ng-like roots seem devoid of any rootlets l are very bad to handle. The rosy kes, rising from the glossy, leathery leaves Pyrola asarifolia red wether green, are y charming and grow here plentifully, , like the rest of the family, are, I believe, lined to be parasitic and need an acid soil. at fertiliser should I use with these wood-d plants, as they require an acid soil? the running nature of the plants be cked so as to be grown as pot plants in de? "AMATEUR."

anada.

We have never heard of any fertiliser be-used for these plants. Here we try and e them the acid soil and scatter Pine dles over them. They like light, not se shade, in England, and we have seen m in nearly full sun on woodland edges the sea. Nurserymen grow them in pots sale, but they are always difficult to do. have never tried them in pots, and so have only succeeded with the white form. maphila has so far failed.]

mula species

M. B.).—Primula sp. K.W. 5906 is ned P. pudibunda. It also came up ong P. microdonta alpicola. It is best cribed as a refined Sikkimensis. P. ltoni K.W. 6094 is a distinct species with utiful ruby-coloured flowers. The leaves habit of flowering is similar to P. kimensis. It is a first-class garden plant likely to become very popular. The et form is P. microdonta alpicola violacea. comes in various shades and often pro-es two or three whorls of flowers.

ubled flowered Primroses

T. Y. S.).—These may be obtained from s Adams, Torrent Hill, Dungannon, Co. one, Ireland, and from J. Stormont, kbride, Carlisle.

racenias

J. A., Canada).—Sarracenias need pond ces for growth, and to be well bedded in surrounded by Sphagnum Moss. They peat and loam with a certain amount of ad, and a sunny aspect.

rdy Cyclamens

gnorant).—Corms of the hardy Cycla-ns must always be planted during their mant period, or, rather, during their rest-period, and as soon after they cease to be ctive as possible. The situation ought to a rather shady one, and it must provide ter from cutting winds. A soil which is entive of moisture is fatal, and a little paration should be given to the selected . Add to the existing soil a compost of ady loam, leaf-mould, and mortar-rubble, plant the corms at least 3 inches beneath h surface. A few rough stones embedded ond groups are appreciated by the plants. od sorts are C. Coum, which blooms ing winter and early spring; C. repandum (which is the true C. hederæfolium), which blooms in April and May; and C. europæum, which produces its purplish-red and sweetly perfumed blooms in autumn. Other sorts are C. vernum, C. ibericum, and C. alpinum, which are forms of C. Coum, and C. ciliatum, which is generally considered to be a variation of C. europæum.

Preparing bed for spring plants

(Ignorant).—For the successful cultivation of the subjects mentioned you have at hand the very materials for the purpose. When the annuals cease to be effective clear them off and, after adding a very liberal amount of leaf-mould, not too well rotted, dig the bed deeply and thoroughly. Allow it to settle and, afterwards, sprinkle over the bed a good dressing of sifted mortar-rubble to which may be added a little sand. Previous to planting, incorporate the mortar and sand with the surface by raking it in. All the things mentioned will, or at least ought to, give the very best results. Do not add any manure, and the use of chemical fertilisers is unnecessary. A light sprinkling of old soot, however, if applied occasionally and during showery weather, will add intensity to the foliage.

FRUIT

Lichen on fruit trees

(Orchard).—The best way to remove the Lichen from your fruit trees would be to spray them with a good tar-oil wash as advised on page 803 of our issue for December 15th last. The cost of washing a 10-year-old tree works out at about 8d. per tree, which is not particularly cheap, but the work is efficiently done. A cheaper way is to use hot caustic limewash, but it is messy to apply and, while killing the Lichen, has little or no effect on insect eggs. The recipe for limewash is to take 15 lbs. of best fresh lump quicklime and just cover it with water, and allow to slake; then gradually make up to 10 gallons with more water, stirring all the while. The resulting limewash must be carefully strained before it is put into the spraying machine, and a coarse nozzle used.

Spraying fruit trees

(A. G. Forbes).—It should be sufficient to spray your fruit trees once with the tar distillate wash and you should take the first opportunity to get the work done in case bad weather prevents the work being done at a later date. If Red Spider troubles you later on use a dilute solution of lime sulphur. One gallon of concentrated wash added to 99 gallons of water would be strong enough for the purpose. You may have to repeat the lime sulphur spray several times if the spider is present in quantity. Write us again if we can assist you further.

VEGETABLES

Selection of Potatoes

(W. J. C., Essex).—As a selection of varieties we suggest:—Early Potatoes: Midlothian Early, May Queen, Eclipse. Second Early: British Queen, King George, Great Scot. Late: King Edward VII., Majestic, Up-to-Date. Potatoes vary considerably in different soils, but the above are varieties of proved merit generally.

Treatment of Celery

What is the best treatment for Celery, when earthed up, to prevent it being destroyed by millipedes and slugs? M.

[In order to prevent damage from millipedes and from slugs dust the soil freely with fresh soot before earthing-up. This is usually found to be effective, but if the garden is more than ordinarily full of these pests Celery collars, which can be procured from any seedsman, may be used. Stout brown paper or "corrugated" paper can be used instead of collars, but few people have a sufficient supply of either. The collars are inexpensive.]

MISCELLANEOUS

Discoloured paint

We should be much obliged if you could give us any reason why our greenhouses, recently painted inside and out three coats of best white paint, should in a very short time show a deep purple stain through the white paint wherever a little moisture settles. The contractor suggested that it was through using fumigants or insecticides, but as the stains have also come outside, that, of course, cannot be the reason. W. W.

Northants.

[Your trouble with the white lead paint is a common one with certain houses in certain districts, and we do not think that the contractor can be blamed in any way. This discoloration is due to a fungus which grows under or on the paint, and, apart from the colour, we do not think that it does very much harm to the paint. The trouble is most apparent in greenhouses which are kept fairly moist and warm. We believe that a lot of experimental work has been done to try and make a paint which would resist attack, but we have never heard that the experimenters have ever been successful. If it is a practical proposition it is best to get the work of painting done during summer and to empty and air the house, so that the whole of the woodwork is thoroughly dry before the painting is done. Insecticides and fumigation often discolour white lead paints, but from your description we do not think that they have had anything to do with your trouble.]

Weedy lawn

Two years ago I took over an old lawn which for years had been neglected. After raking off loads of Moss and "matt" I used a Moss-killing fertiliser and then sowed a fair amount of grass seed. This has come fairly well, but I have a lot of rough, stringy, low-lying grass, which I am at a loss how to be rid of. Can you suggest a fertiliser and say what amount and when it is best to apply? My employer has been recommended sulphate of ammonia. "CENCI."

[You do not state for what the lawn is used. If it be purely for ornamental purposes we think that you would be well advised to give the area a good dressing of quicklime at the rate of 1 lb. per square yard. This material should be applied at once. Follow this by giving a mixture in equal parts of high-grade basic slag and kainit applied at the rate of 8 ozs. per square yard towards the end of February. This treatment, if allowed to work for a year, should have the effect of reducing the "matt" and encouraging the firm grasses and Clovers to grow. If the lawn is used for tennis or other games the growth of Clover slows down the pitch, but even this would be better than the present condition of the turf. Would it be possible for you in the spring to again rake the lawn and so lift a lot of the rough, low-lying grass so that it could be cut by the machine or scythe? Such treatment would give the other grasses a much better chance to establish themselves. Sulphate of ammonia applied as a top-dressing to a lawn is a great help towards improving the turf when it is in a poor condition, but without the cause which produces a "matt." Your previous treatment has done much to remove the actual "matt," and if you adopt the manures suggested above you will remove the acid conditions which produce the "matt" and so prevent a recurrence of the trouble. The grass you mention is always a feature of soil acidity. Write us again after you have applied the above manures and allowed them a year to alter the soil condition, then we could advise you how to effect further improvement with sulphate of ammonia.]

Poultry manure

I shall be much obliged if you will tell me how pure poultry manure at 6s. cwt. compares in value with good farmyard dung at 10s. a load. "MEIKTILA."

[It is impossible to give a comparison of the poultry manure with good farmyard manure because we do not know the condition of the poultry manure. The following figures taken from the Journal of the Ministry of Agriculture, Vol. 31, will indicate that the plant food value varies considerably according as to whether the material is fresh or air-dried:—

—	Manure from Birds at Liberty.		Manure from Fattening Birds.	
	Fresh.	Air Dried.	Fresh.	Air Dried.
Moisture.. ..	59·5	10·0	70·3	15·0
Dry matter ..	40·5	90 0	29·7	85 0
Nitrogen.. ..	1·75	4·0	2·28	6·52
Phosphoric acid	1·00	2·27	·97	2·77
Potash	·54	1·22	·55	1·57

If you read these figures in conjunction with those we gave on page 790 of our issue for December 8th you will realise that poultry manure can be a very variable product. Perhaps the best line we can obtain on good poultry manure is indicated by a set of experiments carried out in Cornwall and quoted in the Journal referred to above. The experiments were carried out on grassland over a period of six years; the comparison was between 4 cwts. of poultry manure and a series of nitrogenous manure, each providing the same amount of nitrogen as in 1 cwt. of nitrate of soda:—

Treatment per Acre.	Hay: Cwt. per Acre, Average for Six Years.
No manure	9
4 cwt. superphosphate	15½
,, ,, + 1 cwt. nitrate of soda	31
,, ,, + sulphate of ammonia	30
,, ,, + dried blood	30
,, ,, + fish meal	30
,, ,, + guano	31
,, ,, + 4 cwt. fowl manure..	30

According to these experiments 4 cwts. of poultry manure is equal to 1 cwt. nitrate of soda, and we consider 6s. per cwt. dear; 3s. would be much nearer the price.]

Spent Hops as manure

(C. C. B., Hythe).—The value of spent Hops as manure is not very high—perhaps about the same, bulk for bulk, as that of half-rotted straw. Nevertheless, if not actively valuable, Hops have a certain use in the way of adding humus to and in lightening the present soil. The material is sometimes useful as a summer mulch. If nothing better is available in the way of manure give the soil a dressing of basic slag at the present time, and dig in a good bulk of the Hops in March. Of course, it is assumed that the Hops referred to are those received direct from a brewery, and not the advertised proprietary Hop manure which is specially prepared.

Liverwort in lawn

(C. T. Russell).—The specimen you send is that of a Liverwort, and its presence is an indication that the drainage of the lawn is at fault. You could remove it by brushing with a hard, stiff besom, or, perhaps, a rake would do. To remove the Liverwort permanently is a more difficult matter. Dig a hole a foot deep in the lawn and examine this hole 24 hours after a good, hard rainstorm. If water still stands in the hole 24 hours after the rain has ceased the area should be drained. If you find that the soil at this depth is drained the trouble lies nearer the surface, and could be put right by following the instructions given to "N. R. J." on page 16 of our issue for January 5th in connection with Moss in a lawn. We are giving you the rough test for drainage in the hope that it may save you the expense of draining the whole area. The brushing and treatment with sand should in any case be followed.

NAMES OF PLANTS

G. C. D.—1, A Spruce, but cannot name without a cone; 2, a Spruce (possibly Abies pungens), must have a cone; 3, Skimmia japonica; 4, Thujopsis dolobrata; 5, Berberis Aquifolium; 6, Cupressus nootkatensis; 7, Portugal Laurel; 8, please send better specimen.

Joseph Bentley, Ltd., Chemical Works, Barrow-on-Humber, Lincs.—General illustrated catalogue of chemicals and sundries.

Daniels Bros., Ltd., Norwich.—Illustrated guide for amateur gardeners.

TRADE NOTE

Fisons' Fertilisers

An interesting feature in the catalogue of Joseph Fison and Co., Ltd., is the report of two experiments recently made at the firm's Experimental Station. The photographs and figures given show how perfectly plants can be controlled and developed with the aid of scientifically compounded plant foods.

LATE NOTES

Horticultural Club

A Club dinner and lecture will be held on Tuesday, January 29th, at St. Ermin's Hotel, Caxton Street, Westminster, S.W. 1, at 6.30 p.m. for 7 p.m. Following the dinner, Mr. William Hales, F.L.S., Curator of Chelsea Physic Garden, will deliver an address, illustrated by lantern slides, on "A Tour to Ceylon, Malay, and Java." The price of the dinner is 6s. 6d., exclusive of wine, and this will be collected at the tables. Members will realise that a subscription of 10s. 6d.—a temporary arrangement—is insufficient to meet the rental of the Club room and other expenses, therefore the Committee has decided that Rule 6, which reads: "The annual subscription for members shall be one guinea. All subscriptions shall be due and payable on the first day of January in each year," must again become operative as from January 1st, 1929, and members are asked to kindly send their subscriptions of one guinea for the current year to the Hon. Treasurer, Mr. Peter R. Barr, 11-12, King Street, Covent Garden, London, W.C. 2.

Dianthus Lady Moore

Many charming Pinks can be raised from seeds of what are commonly called "rock Pinks," and these are generally single Pinks
of the plumarius class. D. Gladys Cra
may be cited as a favourite of this class
an older one called Cyclops is anoth
became the owner in spring of a very
one named after Lady Moore, one of our
ing plant lovers, in which she goes ha
hand with her talented husband, Sir Fre
Moore. Lady Moore, when sending m
plant, expressly stated that it was no
who had named the Pink. It is, howe
really lovely plant for the rock garden or
the front of the border, with large flow
a good rose with a deeper-coloured zon
appears to be of good constitution a

Woolly Aphis

The losses which accrue to growe
Apples because of the ravages of the W
Aphis, or so-called American Blight, are
considerable, for the pest is widesprea
its control is somewhat difficult. The
culty in controlling the pest arises fro
amazing reproductive powers of the
(many generations can be produced i
summer), the highly protected position
insect through the woolly excretions an
globules which surround it, and the fact
it lives on the roots as well as or
branches, hence when the branches o
tree have been cleared by treatment a
infestation may occur as a result of mig
from the roots. To these points mig
added that the pest has few natural ene
and its increase continues largely unch
except by artificial means.

Most varieties of Apples are subject
tack, but those varieties with soft rind,
as Cox's Orange Pippin, Blenheim Or
and Ribston Pippin, frequently suffer
severely, as the ease with which the i
can puncture the epidermal tissues enab
to feed more freely and thus drain awa
sap more quickly. Although wingless
laying females occur towards the end o
season and lay eggs in crevices in the
near the base of the tree, and remain
mant till the spring, it is from vivip
females which hibernate under shelte
rough bark, Moss, or Lichen that the fo
ing year's generation more quickly sp
It is thus clear that the general clean
of the trees is a potent factor in the c
of the pest, and it is well known th
ravages are most acute in neglected orc
where the trees are covered with Mos
Lichens.

While the use of a caustic winter wa
tar distillate spray may destroy a large
portion of the hibernating insects and
some may survive, and a sharp loo
should be kept for the first traces to appe
the young wood in the early stages of gr
These should be attacked by spraying
paraffin emulsion, or they may be effec
checked by applying methylated spirit t
white wool covering by means of a
brush, and if such treatment is assidu
followed up the insect may be eradicate
season.

Where infestation of the roots occur
pest is more difficult to deal with, bu
best plan is to use bisulphide of carb
injecting a small quantity of the fluid in
soil at points about 2 feet apart over the
ing area of the tree. The difficulty of
plete control, however, is obvious, and
bably this can more easily be effected b
use of stocks which are immune or h
resistant to the attacks of the pest. I
long been known that some stocks are
resistant than others, and recent inve
tions indicate that the quality of immun
a varietal one. If, therefore, this quali
immunity can be bred into a stock posse
all the other qualities which constitute a
ful stock the future control of the pes
be considerably facilitated. W. AUT

By Appointment.

LAWNS Require Attention—NOW

AT this period of the year a small outlay on a scientific fertilizer will work wonders with your lawn and provide an even growth of fine Grasses throughout the season.

If weeds and worms are troublesome, these can be eradicated quickly and without difficulty by means of Fisons' Lawn Sand and Fisons' Powder Worm Killer.

To ensure satisfaction, fertilizers should be purchased from "Fisons' of Ipswich," who have specialized in the manufacture of scientific fertilizers for the past 60 years.

FISONS'
LAWN GUANO
(A Compound Fertilizer)

The safest dressing for turf. It feeds the turf over a long period and will not burn or discolour the grass. Lawn Guano quickly strengthens the roots and encourages a dense growth of fine grass. As used by important clubs and municipalities. Apply now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.
Prices, in Bags: 7 lbs., **3/-**; 14 lbs., **5/-**; 28 lbs., **9/-**; 56 lbs., **15/-**
1 cwt., **25/-**. Carriage paid.

FISONS'
BASE FERTILIZER

should be incorporated with the soil before sowing grass seed. Specially prepared to promote strong root growth and give new grass a good start Use 4 ozs. to the sq. yd. a few days before sowing the seed.
Prices in Bags: 7 lbs., **3/-**; 14 lbs., **4/6**; 28 lbs., **7/6**; 56 lbs., **12/6**;
1 cwt., **20/**. Carriage paid.

FISONS'
LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed, such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.
Prices, in Kegs: 14 lbs., **5/-**; 28 lbs., **9/-**; 56 lbs., **16/-**;
1 cwt., **27 6**. Carriage paid

FISONS'
GRASS SEEDS

are the finest procurable, being tested in our own research grounds for purity and germination.
Special Mixture (for Bowling and Golf Greens, finest grasses only).
Prices in Bags: 7 lbs, **15/6**; 14 lbs., **30/-**; 28 lbs., **58/-**; 56 lbs., **110/-**;
1 cwt., **210/-**. Carriage paid.

The Surface that survives!

The Mote Park *Maidstone*
Photograph by courtesy of the Rt. Hon. Lord Bearsted

This beautiful drive was treated with Colas in August, 1927. In spite of the heavy traffic carried and the appalling weather conditions last winter *no repairs of any kind have been necessary.* A dressing of Colas, applied *cold* at any time of the year without special skill or apparatus, will modernise your drives and paths *without spoiling their appearance.*

One drum containing 30 gallons, costing 40s., delivered direct to destination within the Railway Company's free delivery area, will cover approximately 100 sq. yds. of gravel drive or path. A considerable reduction is offered if two or more drums are ordered.
Write to Estates (K) Department for 24 page booklet and prices.

"FERRY" BRAND
Regd. Tde Mk.

GARDEN MANURE

"FERRY" Garden Manure is an organic Manure for general purposes. Suitable for Flowers, Fruits, and Vegetables. Replenishes the soil with the important plant foods. Apply 2 to 3 ozs. per square yard and dig it into the soil NOW.

W. F. H., Haverfordwest, reports: "*Runner Beans 15 ins. long when picked, not selected . . . Parsnips 3 ft. 2 ins. . . . Carrots 2 ft. 9 ins. The Peas were excellent, 12 peas to the pod. The results have been magnificent.*"

14 lbs., **3/9**; 28 lbs., **6/6**; 56 lbs., **12/-**; 1 cwt., **21/6**

"FERRY"
HUMUS MANURE

is the only satisfactory substitute for Stable Manure. It improves the physical condition of the soil and enriches it with the important plant foods. It is equally valuable for heavy and light soils. Not to be confused with cheap Hop Manure. Contains 10% Phosphates.

J. W., Liverpool, writes: "*I have had the best all-round crops on the land.*"

28 lbs., **4/6**; 56 lbs., **7/6**; 1 cwt., **12/-**

Obtainable from Nurserymen, Seedsmen, Stores, etc., or C.P. from the Makers for cash with order.

Clean Trees mean Clean Fruit

The best time to attack a pest is in its egg or ova stage; it is then stationary and more "get at-able," and a higher concentration of wash can be used without harming the tree.

Abolene is the ideal dormant tree wash. It clears away moss and lichen and destroys Insects' Eggs. In recent trials trees sprayed with Abolene produced the heaviest crop of Apples.

Pint, 1/6; Qt., 2/6; ½-Gall., 4/6 Gall., 7/6.

Seed Lists

By Sir William Lawrence, Bart.

WHEN the skies are "ashen and sober" a scurry round the garden is enough. I throw another Lilac log to the fire and, to the crackle of "Mme. noine," I start on the seed lists.

irst of all, to use a phrase beloved of my ow-writers, I must choose "suitable sub- s to furnish" the annual border. Antir- iums I leave to Mr. Everatt, who used to w terraces full in Scotland, and with a king heart I start on eight pages of ers. Now the highbrow catalogue says, sters, see Callistephus," but this trick not had the success he original "Mari- d, see Calendula." trol stations, to se the R.B.A., have lers of annuals, and resent the following plet to a motorist stops to fill up:—

> hat are the flowers
> we see beneath us?
> alendula and Callistephus!"

he catalogue I am king at lists 397 rieties of China er! Who grows ers to such an ex- as to require 397 eties? I have never taken by a gar- er to see the Asters, are they a con- uous feature of the aces of great houses the beds of Hyde k. I am lost in this er. Ought I to r Pæony-flowered, Ostrich Feather, or us, or Californian, merican? I would "clear yellow" "sulphur-yellow," only I know that e are really and truly no yellow Asters more than blue Asters. An Aster I like ts by being white, with a violet flush, finishes by being violet all over—and I at least 12 that do this. Let us pass to her holy terror, Stocks. Of these there only 224. What is the difference be- n Ten-week Stocks, Brompton Stocks, Lothian, Summer, Autumn, Winter, ng, Nice, Excelsior Stocks? I should a "Heavenly Blue" Stock, but I look in the colour chart and desist. I am ly useless at this kind of thing, so leave the Stocks and let's get on.

At the Wisley trials there were some lovely annual Lupins, and I have ordered L. Hartwegii in blue, Heavenly Blue, white and rose, L. luteus Romulus, L. luteus splendens, L. nanus in blue and pink, having already my own saved seed of L. pilosus (that gracious fodder plant), L. Cruikshanksii, which comes out white and fades to purple, and that dainty dwarf, L. lepidus. A lovely thing at Wisley was the bright blue Salvia farinacea. I am not ordering the white form. Of scarlet Salvias, Harbinger and Fireball are the best. An annual I am never without is the blue Pimpernell. In Spain this plant is perennial and a sub-shrub, but if you plant the shrubby form in this country the woody stem dies down and a herbaceous form, identical with the annual, appears. This sounds like a fable, but it is vouched for by Mr. Ingwersen and Dr. Giuseppe, and I should as soon doubt Liddle and Scott as these two cultivators! Bartonia aurea I always have, and that pretty Cape plant, Diascia Barbaræ, the colour of Rose du bois Kascha. Next, two peerless plants, Hunnemannia fumariæfolia and Ipomœa rubro-cœrulea præcox. Hunnemannia makes a little grey-green bush of finely cut foliage from which rises in straight, upright stems glorious clear yellow flowers, which last a week cut and remain widely open. Ipomœa is the sky-blue Morning Glory, perhaps the loveliest plant in the garden. It is not too easy to get away, and the seeds are best sown singly in 60's. Order præcox as many varieties bloom too late to be of use. Single French Marigolds (Tagetes patula) I like, and the old Legion d'Honneur is as good as any. The big French Poppies are glorious and fill an immense space for the expenditure of a few pence, but their season is short. The largest number of "fixed" varieties is to be found in French seed, and the same applies to Viscaria (a variety V. bleu Dauphin is charming). The English strains of Antirrhinum and Sweet Peas are incomparably the best, and, indeed, most foreign strains of seeds are supplied by English nurserymen.

Lupins, both perennial and annual, form a pleasing feature of many gardens, and may readily be raised from seed

Lupinus polyphyllus, here illustrated, gives an abundance of long spikes of delicately scented flowers in June and July. Sown in March and treated as annuals, they make a fine show in the autumn

All this is child's play. Now I take up Thompson and Morgan's list, the list of the Floraire Nursery (Correvon), of Sündermann at Lindau, the lists of the Botanical Gardens at Kew, Edinburgh, Kirstenbosch, Peradenia (Ceylon), etc. As I only grow such Alpines as kind friends give me I am not a serious student of Correvon and Sündermann, but I picked out Gilia agregata, an elegant and brilliantly coloured Californian plant with a genius for damping off; Hylomecon vernale, from Japan, I think, like a yellow Eomecon; Lithospermum Gastoni, which I failed to find in the Pyrenees; that exquisite little Poppy, Papaver triniæfolium, which makes a rosette of blue-grey lace; Paris quadrifolia, which I want to naturalise (but Paris is dreadfully slow, even if you grow it on in heat); the pink Scorzonera; and Trientalis americana (because T. europea does well!).

Different botanical gardens adopt different methods of arrangement. Kew divides the seeds into "Hardy Herbaceous" and "Trees and Shrubs," Edinburgh into "Plants in the Open" and "Plants under Glass," Cambridge "Monocotyledons" and "Dicotyledons," Kirstenbosch into "South African Seeds," and others. A few things noted are Adonis flammea, Aphyllanthes monspeliensis, that dainty little plant with blue Lilies on Rush-like stems, the Cyananthuses, which are so difficult to grow here, Linum monogynum, which goes on well until a hard winter kills it, a few Primulas, the two "Kangaroo Paw" (Anigozanthus) for the greenhouse, Boenninghausenia, of which we read so often in "The Times" on Saturdays, Lathyrus pubescens and Lonicera Hildebrandiana, two first-class plants under glass, and, indeed, "nearly hardy," Sutherlandia frutescens, lovely in September with its apricot, Pea-shaped flowers and grey foliage, Templetonia retusa, another "nearly hardy" plant, with warm, mahogany flowers, Veronica Lavaudiana, pretty but difficult, Bellis mexicana, merely because I have no idea what it is, and I love B. silvestris and B. rotundifolia, Chrysanthemum Gayana (because I want to see the difference between this species and G. Mawii), Laurentia Michelii (because I already grow the slender Laurentine with its little blue and white Lobelias), Ourisia macrocarpa (because this is a family we fail with), and the peerless Eustoma, which the magician of Hyde Park grows in flower-beds! These lists from botanical gardens, being intended largely for students of classification, etc., contain a number of grasses, yet none contains that rare British gem, Mibora verna, which used to be grown in greenhouses and looks for all the world like Pampas Grass seen through the wrong end of a telescope.

This is becoming a catalogue itself, so I will content myself with saying of the private lists that my heart stood still when I read "Weldenia candida"!

Burford. William Lawrence.

A long border of double-flowered Stocks at Kew

East Lothian Stocks

This fine and well-known strain of the Intermediate section of Stocks should find a place in every garden wherever there is space for the plants to grow and attain full development. They are adapted either for bedding out or for the mixed border, where they always make a fine display until late in the autumn, when they usually have to make way, especially in the first instance, for spring-flowering subjects, but in the last-named they will, if left, flower most profusely in the succeeding early spring months in the warmer parts of the country. When so left I have known them to become very large bushes by the end of the season, passing unharmed through the winter, and supplying a great quantity of flowers for cuttings afterwards in the spring, when they are much appreciated. I have also found the Lothian Stocks equally valuable for winter and early spring flowering under glass. I remember the time when the ordinary Intermediate strain used to be largely grown for that purpose with varying results, but at their best the plants would not compare with those of the improved East Lothian strain for robustness of habit in regard to growth or floriferousness.

For winter flowering the plants are, of course, raised in early autumn, but for summer and autumn display the first or second week in February is a good time to sow the seed and germinate it in gentle warmth in a greenhouse. In order that the seedlings may be sturdy the seed should be sown thinly in pans, and, when up, placed on a shelf well up to the light. Here they should remain until ready for pricking out in a frame on a bed of leaves or slight hotbed. It being very essential that good balls of soil should be obtained when the plants are lifted for planting, the compost in which they are pricked out should consist of two-thirds loam and one-third flaky leaf-mould. A distance of from 5 inches to 6 inches should be allowed between the plants in either direction, and until the roots get a hold of the soil keep close and shade from the sun. Afterwards ventilate the frame in accordance with weather conditions and aim at growing the plants as hardily as circumstances permit, so that when ready for planting out each will be a sturdy little specimen. When they begin to grow freely and the weather is fine and sunny the sashes may be partly or completely drawn off for a few hours with advantage. Watering must be attended to, and when planting time arrives give a g soaking some 12 hours prior to lifting.

Beds in which they will eventually planted should be well manured a week so beforehand and the positions they ar occupy in the border similarly trea Planting time varies according to local ditions. In some cases it can take p early in April, in others it has to be defe till the beginning of May, but the ea within reason the better the results.

H. W

Honours in horticulture

The Council of the Royal Horticult Society at its meeting on December 1 1928, awarded the following Cups Medals:—

Victoria Medal of Honour to British h culturists resident in the United K dom deserving special honour at hands of the Society.

To Mr. Alexander Malcolm, the known amateur raiser of Sweet Peas.

To Mr. W. Atkinson, the managing di tor of the renowned nurseries of Me Fisher, Son, and Sibray, of Sheffield.

The Lawrence Medal for the best ex shown to the Society during the year.

To the Hon. Vicary Gibbs for his ex of vegetables on October 9th, 1928.

Veitch Memorial Medals and Prizes to t who have helped the advancement improvement of the science and pra of horticulture.

To Miss Gertrude Jekyll, V.M.H.: Medal and £50 in commemoration of services to horticulture and gardening.

To Mr. C. G. A. Nix, V.M.H.: Gold M for his services to the Society.

To Mr. John Fraser, F.L.S., V.M. Silver Medal and £50 for his work on P goniums, Salix, and Mentha.

To Mr. Samuel Smith, The Gard Pengerrick, Falmouth: Silver Medal for work in hybridising Rhododendrons.

To Mr. W. Reynolds-Stephens, P.R.B Silver Medal for his work in connection the Sculpture Section of the Internati Exhibition of Garden Design on Oct 17th-24th, 1928.

The Cory Cup for the best new hardy of garden origin shown to the So for the first time during the current

To Mr. F. C. Stern for his Rosa downensis, which was shown on Septe 11th, 1928.

The Loder Rhododendron Cup for not m floral display, but the value to hort ture of the work of the recipient, wh such work includes the productio flowers or not.

To Professor Wright Smith, of Edinbu M.A., F.L.S., V.M.H., in recognition o very valuable work on Rhododendrons Azaleas.

The George Moore Medal for the best Cypripedium shown to the Society du the year.

To Mr. R. Paterson for Cypripe W. H. Moore, Stonehurst Variety, w was shown on November 27th, 1928 illustration issue December 8th, 1928, 786).

The Sander Medal for the best new g house plant shown to the Society du the year.

To Baron Bruno Schröder for Amar Baroness Schröder, which was shown April 24th, 1928.

The Williams Memorial Medal for a g of plants of one genus which show e lence in cultivation. Fruit and v tables are excepted.

To Lady Aberconway and the Hon. H

cLaren for their exhibit of Primulas staged Chelsea, 1928.

To Messrs. Sutton and Sons for their ex- bit of Cyclamen staged on February 28th, 28.

These Cups and Medals will be presented the Annual General Meeting of the Society Tuesday, February 26th, at 3 p.m.

F. R. Durham, Secretary.

The Mulberry and the flower border

ONE of the joys of September is the ripening of the Mulberries on a young tree planted about 20 years ago. A ulberry should always be planted on grass, some of the best fruits are those that fall themselves. While they are falling it is ll to sweep the turf under the tree every o days, as many that come down are halften by wasps and others are trodden into messy squash. The Mulberry stands on a rrow lawn that runs the length of the main wer border. A high wall is at the back the border. Next the wall is a 4-foot rder and then a narrow path—not a made th, but just a little alley-way convenient getting at the back of the border and at is on the wall. Against the wall is a oup of Bays, and nearer in the lower picre a well-grown Magnolia conspicua and a oisya, their tops framing a doorway and ning in with a Guelder Rose that is at the ck of the wall. The whole space is large ough to admit of these bold groups, and ey form a good background to the flowers the border. Nearby, in front of the Bays, a mass of rich red, showing dark in the ture. Nearer the eye are white Dahlias, Yuccas (now out of flower), and to the extreme right the creamy-white Aster umbellatus, Hydrangea paniculata, and the lovely Aster acris, with a front planting of white Snapdragon and dwarf Ageratum.

The south border in September

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

oposed Society of Garden Architects

HAVE been greatly interested in the recent letters on garden architects and the proposed Society or Association which some uld like to see formed. Such an Associan, composed of the right type of members, would no doubt be all right, but is such a Society really needed?

When we think of the stately homes throughout the British Isles and their pleasure grounds and gardens, and think of the qualifications of such men as Capability Brown, Sir Joseph Paxton, and the veteran, Wm. Robinson, the founder of this journal, to mention only a few, I do not think that garden owners are going to benefit so very much by a Society of Garden Architects. Members would possibly get uniform fees for water colour drawings and plans, similar to those received by a prospective house owner from his architect before he commences with his building.

A gentleman of my acquaintance received some of the aforementioned drawings and plans for his garden from an architect who also passes as a garden architect, and, to my surprise, practically all the rooms on the ground floor of the house would have to be re-arranged to suit the alterations in the garden. Needless to say, this was going to cost more than the garden owner bargained for. Now, I was under the impression that the gardens were made to suit the house, and not the house to suit the garden. Had this garden architect known more about horticulture I am sure such a suggestion would never have been put forward. The result is that the scheme is left on the table. I could mention instances where architects had the planning of ranges of hothouses which were an absolute failure from a horticultural point of view.

Why architects break into garden design I do not know, unless it be that there is not enough work for them all in the building trade. Should the proposed Association be made of such members I sincerely hope that owners of gardens requiring advice will be wise enough to call in the services of a good, practical foreman who has spent his whole time on such work from some of the larger nursery firms who are specialists in the laying out of grounds, or some person who has made landscape gardening his only profession. The successful arrangement of flower and vegetable gardens requires an expert knowledge of the needs of plants, and this should be fully considered before any special design of walks, borders, or beds are thought of. At the present time we are getting too much repetition of other people's work and not enough originality. We see sunk gardens, rock gardens, acres of crazy paving, and low retaining walls in place of grassy slopes wherever we go. I agree with Mr. Adams when he says that an architect's design shows too much stonework and ornament; each very nice when carried out in moderation, but both a great deal over-exploited. The Chelsea, Shrewsbury, and other large provincial shows are responsible for much of this present style, and the earlier the R.H.S. encourages originality the better it will be for British gardening, which has attained a high position throughout the world.

In conclusion I would suggest, like Mr. John Adams, that the word architect be dropped and something more suitable found to replace it. Garden designer or landscape gardener are, perhaps, not so high sounding, but they are, at least, much more appropriate. ALLEN-WATER.

The "Best" Peach

Your Scottish correspondent's note on this subject (issue January 12th, page 27) is very interesting and valuable. A word from the nurseryman's point of view may be interesting as to the Peaches in greatest demand, and of these Hale's Early is undoubtedly more planted than any other. Closely following this would come Peregrine, which your correspondent does not mention, but which is rapidly coming into the front rank and is more planted than Royal George, I should deduce from my own experience.

The best Peach to eat, which your correspondent does not mention, is, in my opinion, Bellegarde, but I quite agree that as an all-round Peach Royal George holds its own in popular estimation. E. A. BUNYARD.

Ranunculus Lyalli

THE reference by E. Markham to this New Zealander is interesting. Probably it is capricious to grow in England, as it is here also away from its natural habitat, but growing in the Southern Alps, as I saw it some years back on the McKinnon Pass, in large bold groups, it is a noble plant. There it is usually covered with snow through the winter months, and even in the summer at times. A. E. GRINROD.

Auckland, New Zealand.

Primula farinosa

" Pretty Birds' e'en " as a trusty perennial may well be the despair of the rock garden, as this, the most beautiful of our wild flowers, is a difficult subject to cultivate.

During the last year or two I have collected a number of plants from the marshes which surround Sunbiggen Tarn, a desolate pool made eerie by the cry of 10,000 gulls. Here the Bird's-eye Primrose shares with nesting plovers the tufts of grass rising above the peaty swamp, but, of course, in Yorkshire and Westmoreland this plant is not only found in marsh lands, but ascends the hills.

An amateur's efforts to establish collected plants may be of interest. First an endeavour to reproduce natural conditions by means of a tub sunken in the ground filled with a peaty mixture was made, and some 60 plants packed close together for root association. All flowered and produced abundant seed the first year, but only the older plants survived the autumn.

I have found repeatedly that old plants of Primula farinosa are more safely transplanted into the open than seedlings, and, as this is such a contradiction of the general rule, think it worth noting. Other good-sized plants were put in the granite scree and well watered throughout the growing season. Here there were no failures due to winter's toll, and they will probably run their life of three or four summers. I cannot subscribe to Farrer's early view that the plant " thrives best in sticky, very heavy loam, kept fairly dry throughout the growing season and almost incessantly wet throughout the resting and sleeping times."

Isolation it certainly hates, but one cannot gratuitously introduce tufts of grass into the rock garden, and Gentiana verna, as sometimes recommended, is too precious with me to act as its foil, so clumps of a dozen heads or so in the moraine or on a bank where early autumn wet will not cause the crowns to rot is the treatment which has met with most success in my garden.

Primula farinosa acaulis I have found, but somehow it seems that the flowers nestling among the foliage lose much of their fairy charm. A batch of the plant received from the Alps are of a decidedly brighter and truer pink, and also have the further advantage of being less lush in leaf and flowering just about four weeks earlier each year than our native forms, the dates approximating the fourth week in April as compared with the third or fourth week in May.

These Alpine dwellers, even when transplanted to the softer conditions of the English climate with its longer summer, still cling to their native habits of hurrying into bloom, anxious to flower and set their seed safely in the brief flash of an Alpine summer.

Ranunculus Lyalli

On the whole, perhaps, there is more chance of success in cultivation with plants collected from higher and drier altitudes.

It was doubtless remarked by those visiting the Primula tent at Chelsea last year that of the several exhibits of P. farinosa alba there was no batch of plants which one could really describe as true albino free from all suspicion of pink.

It would be of interest to obtain the experience of other gardeners growing our delightful little native, and to know whether there are at present any true albino forms in cultivation, especially the large-flowered P. f. alba Saundersæ. F. H. FISHER.

The rock gardens at Chelsea

I HAVE followed with immense interest the letters both for and against the policy of the R.H.S. shown in the letter issued regarding the rock gardens at Chelsea, and to me the mere fact that the point has proved so controversial is proof enough that a change of ruling was both imminent and necessary if only temporarily—surely those great men who produce our plants and transform our gardens are big enough to give
" the other fellow's opinion " a trial, fc
we have recently been told, limestone
been tried and has won for some years
altogether, I think, because of its entire
ability, but chiefly, as " M. F." says,
easier by far, and to quote Mr. Dillis
" the true artist will always select
material which best suits his purpose."
does, true enough, for does not the ver
finite strata in the formation of lime
lend themselves, nay, give themselves t
building of exactly the type of garde
have grown accustomed to seeing at Ch
and the less adroit of our gardeners
make a far better display with the sto
question than with sandstone, which, th
equally suitable, demands greater ski
the laying, simply because it is lumpier
does not lend itself to stratification.

With regard to cost, sandstone is
tainly the cheaper, unless, of course, on
purchase limestone as local stone; bu
the whole, the former is quoted by
firms at about one-third the cost of
stone (it is much cheaper locally), and
is there among us who would not rathe
vest two-thirds of the cost of the sto
plants?

Geologists and specialists in A
almost generally contend that sandsto
equally as good for the cultivation of Alp
Reginald Farrer says on the subject: "
body wants, and many are unable, to s
much money on importing stone," and
on to say that if one can spend, lime
from the Craven district of Yorkshire i
ideal; but, he says, " Any stone th
clean is suitable, and not too muc
wanted." Further, although lime-h
plants do not form a huge percentage o
whole of rock garden flora, it is signif
that chief among them are the Mecono
the blue species of which every Alpine
to-day is most anxious to include in h
her collection.

Another point which correspondents s
have missed is that, apart from the fact
the colour of the stone modifies and
tates, in a year or two it becomes, or sh
become, mostly covered and draped wit
those beautiful Mosses and trailing p
whose colours are right anywhere and
are reminiscent of any well-established
garden. This one misses at Chelsea,
apart from a few plants in the crevices
gardens are filled with numbers of s
plants, more or less in irregular
whereas the same plants full grown ar
their proper environment would look
different and tend to cover some of the s
thus giving the real garden effect to
natural outcrop.

The ideal, surely, must be that w
tones with the surroundings in each
dividual case, and this is not always
stone; let us, therefore, if only for one
have the gardens at Chelsea constructe
tirely of sandstone, and let us, above
have the same keen competition among
garden makers, and may the greatest a
again be represented. V. M.

—— I cannot join with Mr. Dilliston
disclaiming the importance of our a
ments. It is to me a very serious subj
that of " awards " especially—and I am
going to write columns about it and
deny its importance.

Also, I defy him (albeit in accents te
to show a single point of my screed of
cember 22nd to be inconsistent.

I did not show at Chelsea between
and 1927, and neither I nor other people
become wearied by the constant repet
of mountain limestone until much n
1927. Last year (1928) I also used it,
Cheddar and from Yorkshire, in com
with sandstone, and the effect was qu

rmonious. Why not? It is even natural. ere are plenty of sandstone boulders ongst the limestone on the sides of Ingle- rough where they have rolled down from top which, in places, is *all* sandstone.

I thank Mr. Dillistone for classing me ongst the "great artists." I take your reful readers to witness that I had not ne so myself—whatever I may have ought. But he is all wrong about 1915. exhibit *was* of limestone. I had a mar- llous sheet of bloom over it, but the effect s too warlike altogether. I was in iform, and whether it was that I was too shful that the exhibit should partake in ne measure of the atmosphere of those es or the fact that I was not able to be on ground more than a few minutes every y, and practically had no time to do any- ng but interfere, I cannot say, but cer- nly the effect was that of a moderate piece rockwork garishly planted and far too lerly to bear out the character of either ne or plants—massed companies of ntiana acaulis, detached platoons of white xifrages, etc., being harassed in rear by esponsible squads of Phlox Vivid—every- ng redolent of the parade ground. All s was too good to be true, especially the entians, each plant of which was probably ected from a dozen non-flowering ones— e usual procedure with businesslike ex- itors.

Single blocks of sandstone carefully placed can be very effective

Sandstone grit is used to prevent erosion of the banks of swift streams, and is both very picturesque and useful

Streams liable to flood must have their banks strongly revetted

Sandstone is most useful for this

If I believed in "awards" I should say at, for its half-heartedness, this effort did t deserve what it got—a Silver Cup, I ink.

Something good came out of the mixture d chaos of thought (at the 1912 show) at show itself. There were several outdoor rdens and effects there which have not been ualled since. I merely hinted at a few in issue of December 22nd. I have, I ink, made it quite clear in the same letter at Col. Durham's "forward move" is ward promotion of that free spirit of experiment so sadly lacking in our big show nowadays.

The "mission" (Mr. Dillistone objects to the word somewhat) of the rock garden section at Chelsea is (to Col. Durham, as I said) the putting before the public of a fairly representative show of the artistic skill and the stone and other material resources of our country. The use of limestone alone as a medium is neither fair to the rock builder nor to the other kinds of stone, so Col. Durham gives a kindly hint to the effect that other media would be welcome.

Not so much "strictly business," please! English people do not like it shouted at them from rock gardens any more than from other works of art. I have seen an exhibitor lovingly place bunches of the beautiful clean coralline roots of a waterside Willow in his pool where they would show to advantage and be quite proud of his little "touch of Nature." Did he think of business? Not

imula farinosa (British Bird's-eye Prim-
se) is at home in this Yorkshire moun-
n limestone, and its bright pink colour
es beautifully with the blue of Gentiana
acaulis planted alongside

"strictly," anyhow. And he did not take them out when another exhibitor told him these roots would "in a real rockery simply befoul the water in time."

"Art for Art's sake" is quite right if one really believes it. The phrase has, by overuse and abuse, become somehow connected with dilettantism. If one really takes it in its serious sense it is, to a large extent, expressive of the mental attitude of the very greatest artists of all time. But, of course, I do Mr. Dillistone the justice to say that he is evidently putting the phrase forward in its slang sense.

I have not read any of Mr. Dillistone's remarks so unfairly as he says. I should not accuse a man of his experience of thinking for a moment that "no other stone is suitable for the construction of a rock garden."

I am more concerned with that remark which says that exhibitors *have*, and have always had, that "one big free field for self-expression." It is quite true that there has never been any rule compelling exhibitors to use any particular material (nor to commit any other particular vice), but, as I have before explained, the present giving of "awards" makes many afraid to experiment on any other stone than that used by his neighbours, because an "award," though an evil thing, serves in itself to prompt the public mind. This is speaking generally, because, of course, there are always those minds too courageous to be so blinded, and which are strong enough to form an independent judgment, prompted only by the beholders' individual tastes.

It is hard to have to explain one's "clever" remarks. Enough to say that if I asked an artist which he regarded as the "ideal" colour he would not necessarily give me a "soft" drink, nor even a nice one, nor would he necessarily be hospitable. But mine of December 22nd did not say nor mean anything like "a certain colour most suitable for certain purposes." Also, I must say again that if limestone be as suitable for large rock gardens as it is for small ones it cannot be *eminently* suitable for either. Pax! This is not garden talk.

Again, and for the twentieth time probably, I say that the exhibitor before whom "awards" are flaunted is a tied man, worried by petty thoughts all the time that he should be quietly generating fresh ideas and ways of bringing them into sight.

I only wish the R.H.S. Council were as easily prevailed upon to discontinue the giving of awards as your correspondent, "M. F.," thinks they might be. Others beside myself have represented all kinds of trouble arising from the practice for some years past, not merely on our own individual account, but for the benefit of the peace of mind of the community (of rock builders).

I have received letters from one or two gentlemen naming "local" rocks I have not seen used for rockwork before, some of which sound rather good, though I would rather see samples first. Some rocks contain minerals poisonous to plant life. I find also that most kinds of gritty sandstone are rather more sympathetic to plants than mountain limestone. J. Wood.

4, *Fitzroy Street, W.* 1.

—— I have read Mr. Wood's article (issue December 22nd, 1928) about rock gardens at Chelsea. I often wonder why gardeners do not use Welsh stone. We have beautiful rock and quantities of stone, especially along the coast. I am not a geologist, but I believe the stones I mean are glacier remains; certainly in shapes and colour different from anything I have seen at Chelsea. They are *not* slaty shale; we have plenty of that, too. There is also red jasper in Carnarvonshire.

Aberdovey. A. C. C. W.

Choisya ternata "even in Scotland"

Whilst "L. J. C.'s" letter on a Cornish garden (issue December 8th, page 785) is interesting, he seems, however, to have formed a very poor opinion of Old Scotland, or is it grievous ignorance of the country?

I would point out for his edification that Choisya ternata, Camellias, and such-like stuff are used on its western seaboard as shelter plants and hedges for the more tender subjects, among which might be named Rhododendron Dalhousiæ, R. fragrantissima, R. Lady Alice Fitzwilliam, or Grevillea and Embothrium, all usually found in English greenhouses.

"L. J. C." has evidently formed the opinion with not a few of his countrymen on the other side of the border that Scotland is a bleak waste of water, rocks, and bog, with perchance an intermittent tuft of heather here and there. Where the natives bound about from crag to crag, scantily clad, with bare legs and mops of red hair (as seen in the pantomime), blowing a whisky-ladened breath into a machine called the bagpipes over a somewhat inflated stomach, doubtless owing to surfeits of haggis. I can assure him this is not quite correct, and there are men who do not bite "even in Scotland."

Granted there are not many Peaches growing in the open in Motherwell or Shotts, neither are there at Wigan nor Durham, but if he takes a trip along the western seaboard of Scotland commencing, say, at Logan, in Wigtownshire, taking Loch Ryan, the Ayrshire coast, the Clyde Valley, Argyllshire coast, Stonefield (where he will see Eucalyptus 40 feet to 50 feet high and Desfontainea spinosa 10 feet in diameter), Inverness-shire and Ross-shire coast up to Poolewe. At the end of his journey he will perchance be forced to say some things do grow "even in Scotland."

December is the bleak time here, nor will there be much bloom till nearly the end of this month, though a lady writing me last week said she had plucked no less than 26 different blooms in her garden "even in Scotland."

Mr. J. G. Millais, of Horsham, who knows the west of Scotland extremely well, and whose book on Rhododendrons is the standard work on the species, invariably couples Cornwall with the west of Scotland, never with Middlesex and Guildford.

If "L. J. C." is not accustomed to rain, he will perchance find *that* "even in Scotland," and he would be well advised should he meditate going thither to take his galoshes. Formakin.

Bishopton.

Truthful catalogues

Your correspondent, "Clay," is a little pessimistic when he says (issue January 12th, page 23): "It is too much to hope that truth in advertising, in the widest sense, will ever invade our beloved catalogues to the extent of pointing out not only the virtues of plants, but also the vices."

Truth, as we know, has not yet been satisfactorily defined, but if "Clay" will continue his researches he will find that there are several catalogues in which nurserymen put the whole truth as they see it in describing their goods, and there is some reason to believe that this practice is spreading. A Nurseryman.

—— I am unable to adopt the heading used by "Clay" on page 23 for obvious reasons, so write under the above title.

I am absolutely in agreement with your correspondent about the misleading descriptions in catalogues of new or newly introduced plants. It is, of course, only to be expected that those interested in their sale
should extol the virtues of their wares,
in some cases I know there is a gen
admiration for many new plants or sh
which I can only call unqualified hor-
De gustibus non est disputandum.
sooner we have a standard colour chart
has several times been suggested, an
alluded to on page 18, the better.

Apart from the exaggerated descript
by nurserymen, I have long ago learn
accept all eulogies by gardeners on ne
praiseworthy plants with a very large
of salt. I have expended "untold gold
recommended plants from time to time
to throw them away as undesirable for s
reason or other. No doubt we all
beauty from different standpoints. I,
example, have a dislike of all double flow
though, of course, there are exceptions
recollect my astonishment years ago at
of the Temple shows, where a lady sto
at an exhibit and ordered some do
flowered plant, I forget what, and follo
up her order with the question: "N
have you anything else double?" indica
that double flowers were all that appeale
her, quite apart from other merits.

Two instances occur to me as I write
note, but only as my personal opinion.
is that the good old Shirley Poppy strain
distributed by Rev. W. Wilks, has
spoilt by modern "improvements."
other is my surprise that Sedum specta
atro-purpureum should have ousted
superior type in some catalogues, though
course, if all were of my opinion there w
be no sale for the dingy purplish form.

There is another point in connection
the value of any given plant from a h
cultural point of view, and that is that
dividuals vary greatly. We see the bes
everything at Chelsea or Vincent Squ
and orders are freely given on the exhi
but how often does not our ideal have a g
fall when the plant arrives and flowers
our gardens? My advice is that garde
should see the plants growing and select
one that appeals most to them, and not o
haphazard from a show or a catalogue.

I do not wish to deny that there ar
whole host of novelties of a most desir
nature, and am not one of those who
to stick to old-fashioned plants mainly f
sentiment, but I do think we want a
more "truth in advertising."

A. H. Wolley-Do

December Roses

I am altogether at one with "A. W.
his tilt *re* December Roses (page 5) at t
correspondents who have sent in account
the "wonderful variety of plants in bl
. . . in the sub-tropical counties of Ha
shire, Kent, and Essex." And, may I
Cornwall and Devon.

I will not flatter Inverness or "A. W.
saying that it is a more congenial spot
this is in mid-winter, but I will say, wit
compunction, that a record of winter blo
either in Inverness or here, represents a
more remarkable state of affairs than a
10 times as lengthy from the "sub-trop
counties of Hampshire, Kent, and Ess
and that many of us gardeners so unhap
situated as to have to struggle to get
thing to do in the more Arctic north
really getting rather weary of our "
tropical" friends' assumption of all tha
marvellous or even "freakish" in the
formance of plants in their gardens,
though they had achieved something won-
ful when, all conditions considered, ther
nothing very remarkable about it! And
haps Inverness and North Yorkshire ma
allowed some degree of legitimate prid
the fact that sometimes they do pro
something verging on the wonders of
south, and, occasionally, on the abnormal

"Alpine slope" facing south at Farnham Vicarage
Erinus alpinus in full bloom

For, when all is said and done, who is the re skilful, to whom is the greater credit e, to him whose lot and gardens are cast the balmy conditions of the "sub-tropics," ere almost, if not absolutely, everything is him, where hardly anything will *not* w, or to him, unhappy soul, whose daily uggle lies amid conditions, of climate, uation, soil, where nearly everything is ainst him, where hardly anything *will* w?

Skipton, Yorks.

Sternbergia lutea

The notes which have appeared lately in ur paper on Sternbergia lutea are interest- g to those who have tried to grow these tumn-flowering bulbs.

I have had an edging of them planted out 20 years ago; they have never been ied. They produce a beautiful foliage ich even now is green and unfaded, but ne years never a bloom, others just a few. e soil is hot and gravelly, which is sup- sed to be what they want. I believe they e lime. Personally, I do not think any lbs which require lifting and drying off ry year are worth bothering about.

C. G. O. Bond.
Furze Hills, Churt, near Farnham.

Saxifraga longifolia

n the note on this well-known subject on ge 27 I see that "G. L." advises one to ommence with strong plants, owing to ir shyness of flowering until the plant be- nes strong." From one sowing I have ays found that, as is generally under- od, no plant will bloom until two years , more often not before three. Does . L." mean by the suggestion above that nting out should be delayed until, say, the nger seedlings are two years old and the aker three, with the idea of obtaining om from most of them, if not all, within few months following planting? If so I not agree, for I have found by experiment t the blooms from plants of which the nting out has been delayed are infinitely erior to those of plants put in permanent itions when quite small; that is, when ge enough to handle and no more, thus wing the bloom to result from a longer roken period of growth.

nd the uncertainty of bloom each year is, course, overcome by planting out a group of freshly raised seedlings each year, so that while one has reached the flowering stage, another is half-way there, and so on.

J. R. K.

Fruit trees and birds

For some years I have been puzzled to understand why certain Apple trees which used to bear well have ceased to do so, in spite of careful cultivation in the way of pruning and fertilising. I now discover that almost every single blossom-bud has been picked out on these particular trees by birds, presumably tits, since we rarely see a bullfinch. The odd thing about it is that in almost every instance the trees attacked are of the late-blooming varieties, viz., Bramley Seedling, Sturmer Pippin, Blenheim Orange, Tom Putt, and Annie Elizabeth, one notable exception being Worcester Pearmain, which has also been completely stripped, while other varieties, including all the dessert Apples, have been left apparently untouched. If you or any of your readers can give me any suggestion as to the best manner of repelling the attacks of the birds I shall be very much obliged. I may say that the trees are too large to net, even if netting were likely to prove a safeguard, which, so far as my experience goes, is certainly not the case in preserving the early eating Apples from the attacks of tits in July and August.

Devon. H. C. G.

An Alpine slope

I DO not desire in any way to take part in the "conversations" between Mr. Wood and Mr. Dillistone, but may I suggest that such a thing as an "Alpine slope" is a possibility? Just sufficient local stone is needed to hold up the pathway on one side and act as a foundation on the lower side.

I enclose two photographs which will show the possibilities. A grand succession can be obtained of what some would call "common" things, but Aubrietia and Erinus, Alyssum and Rock Roses, just a sprinkling of double and single Arabis, Saxifrage, Heuchera, Dianthus deltoides, white and pink single Pinks, Gentian, and Anemone coronaria produced a glorious and beautiful mass of colour.

J. Bernard Hall.
Preston Rectory, Lavenham, Suffolk.

Campanula Miranda

Referring to Mr. F. H. Fisher's note in the issue December 22nd, the actual date of Farrer's sending home this Campanula was 1903, not 1905. In "The English Rock Garden," page 244, speaking of Saxifraga, he states:—"S. æi. Rex. springs from one clump discovered among thousands of the finest sandstone type on the upper moraine of the Dossenhorn in 1903, and sent home in the same box that was also illustrated by Campanula Bellardii Miranda."

J. Henry Watson, F.E.S.
Withington, Manchester.

Iris stylosa

I should like to know if any of your readers have had the same experience that I have this winter with Iris stylosa. Early in the summer a correspondent in France wrote to your paper saying that growers would greatly increase their number of blooms by cutting down foliage at end of July and covering roots with glass until end of September. This I did, and, alas! instead of dozens, I have had single ones, in all only 17. The chief reason I cut them down was that last year the foliage was so thick that I lost several blooms trying to pick them.

Dorset.

FLOWERS FROM SEEDS

Some of the lesser-grown Annuals

I HAVE often been struck when looking through the seed catalogues at the immense number of annuals that are listed and the few we see grown in English gardens. Most of them are easily cultivated, and a gay garden may be had for a very few shillings if an open situation is chosen and ample space is allowed so that each plant has room for development.

The following are what I consider some of the most useful, both hardy and half-hardy:—

ANAGALLIS (Pimpernel).—Large blue, half-hardy, growing about 6 inches in height. This will flower all the season in warm soils, and makes an excellent pot plant for the conservatory.

BALSAM, ROSE-FLOWERED, an old-fashioned half-hardy annual. Sow in pans in April and place in a frame, and plant out in June in rich soil. If carefully grown and potted on, and hardened off before being planted in their flowering quarters they will make fine plants and bloom until the frosts come again.

BARTONIA AUREA, a good hardy annual. Sow in the open in spring. The flowers are bright golden in colour and something like a Thistle. Height, 1 foot.

BRACHYCOME (Swan River Daisy), a bright little blue and white half-hardy annual with flowers something like a small Cineraria. Sow in boxes in frame and plant out in bold groups at the end of May.

CARNATIONS, ANNUAL, a really good strain of seed is most essential. Sow in cold frame in February and plant out when large enough. Excellent blooms may be cut in July.

CLARKIA ELEGANS.—Hardy. Height, 2 feet or more when well grown. This is one of the finest annuals for cutting. The varieties Scarlet Queen and Salmon Queen are, perhaps, the best. They look splendid under artificial light, and are most useful for table decoration. A little superphosphate of soda will work wonders given in small doses just before blooming time.

COCKSCOMB, a useful half-hardy annual for formal beds. Some good ones are generally to be seen in the Dutch garden at Kensington Palace. The Cockscombs look well associated with the feathered variety (Celosias) and such plants as Cineraria maritima. They should be sown in gentle heat and planted out in June.

COSMEA.—Half-hardy, growing 2 feet in height or more, with attractive feathery foliage and a flower like a single Dahlia. White, rose, and purple shades may be had, and also a double variety. They are most useful for cutting, and will bloom all the summer.

DIMORPHOTHECA AURANTIACA, a most charming annual from South Africa. It may be sown out of doors in April. It likes a lightish soil and a sunny situation. D. aurantiaca has rich orange, Marguerite-like blooms with a conspicuous black disc. The hybrids are also beautiful, and range through various shades of cream to almost rose. D. aurantiaca is very striking when associated with Nigella (Love-in-a-Mist) Miss Jekyll.

ESCHSCHOLTZIA.—Hardy. Height, 1 foot. Once sown they will come up year after year, but some of the newer varieties simply must be grown for their rich colouring. The best of these are Double Orange, Carter's Crimson Carmine, and the Geisha.

GODETIA. — Hardy. The double pink variety should be grown for cutting. Sow where the plants are to bloom and thin out to 9 inches apart at least.

HIBISCUS AFRICANUS.—Seldom grown, but it is a showy hardy annual with creamy-yellow flowers with purple markings. Height, 1½ feet.

LARKSPURS.—The tall Stock-flowered varieties are the best, and, to my mind, Rosy Scarlet the nicest colour. Sow where the plants are to bloom and thin out well.

LEPTOSIPHON.—The French hybrids are little gems for rockwork. Height, only 3 inches. Sow where they are to flower. The colours are orange, lilac, purple, crimson, white, and golden-yellow.

LEPTOSYNE STILLMANI, a beautiful annual from California, and is quite hardy, and will flower a few weeks after sowing. Height, 1½ feet. Flowers, pale golden-yellow on long stems. Suitable for cutting.

LIMNANTHES DOUGLASSI.—Hardy, with attractive foliage and yellow and white flowers. Height, 6 inches. It will grow anywhere and is an excellent bee plant. It makes a good edging and blooms in a few weeks from seed. It seeds itself rather too freely, but looks very pretty as an edging to a border of Shirley Poppies.

Ostrich Plume Aster

LINARIA (Toad Flax). — Pretty hardy annuals resembling miniature Antirrhinums. Height, 1 foot. Sow where plants are to flower in March and April.

LINUM (Flax).—The scarlet variety is the best. Sow in open in April. Height, 1 foot.

MARTYNIA FRAGRANS, sub-tropical, but quite easily grown. Sow in pots in frame in March, pot on and plant out on a warm border in June. The flowers resemble small purple Gloxinias and have a peculiar but not unpleasant scent.

MATTHIOLA BICORNIS (Night-scented Stock).—Hardy. Height, about 1 foot. Sow in spring and thin out well. This should be grown for its powerful but delicious scent, which fills the garden when the lilac flowers open at sundown.

NEMESIA.—Well-known half-hardy annuals most useful for bedding out. When well grown the variety Blue Gem has smaller flowers, but is a good pale Forget-me-not blue and makes a charming edging to a bed of pale yellow Antirrhinums.

PHACELIA CAMPANULARIA.—Quite hardy and one of the few annuals with flowers of a Gentian-blue. Some of the best I have s
were grown from seed sprinkled roun
large Rose bed last April. They were in
bloom in July. Slugs love it; that is
worst that can be said about it. Hei
6 inches.

SALPIGLOSSIS.—Half-hardy. Height,
feet. Sow in pans in frame, prick out
plant in beds at the end of May. To
mind this is one of the choicest of annu
the Petunia-like flowers are most artis
The colours are white, crimson, and pur

SCHIZANTHUS.—This is generally treated
a half-hardy annual, but I have obtai
good results by sowing in a sunny posit
out of doors in April. The Orchid-
flowers are altogether charming. Hei
1 foot to 1½ feet.

THUNBERGIA ALATA, a very pretty h
hardy climber or trailer with creamy flow
with a black centre. Sow under glass
spring and plant out in June in sunny p
tions. It looks very well in hanging-bask
or vases in the garden.

VISCARIA.—Hardy. Sow in spring wh
the plants are to bloom. Carter's Blue F
is the best variety and well worth growi
Height, 9 inches.

ZINNIAS.—Half-hardy. These are
treated like Asters. They are little gro
now, which seems a pity as their colours
most artistic. They make a splendid bec
a sunny spot.

For those fortunate people with
warm, sheltered gardens Gerbera James
might be grown. It is really a half-ha
perennial, but often does best when trea
as a half-hardy annual. It is a most
tractive plant with scarlet flowers

FLOWERS FROM SEEDS

1. China Asters in woodland at Kew.
2. Nemesia, dark crimson.
3. Iceland Poppies (Papaver nudicaule).
4. Mont Blanc, a ten-week double-flowered Stock.
5. Chrysanthemum tricolor.
6. Cosmos or Cosmea, invaluable for table decoration. Early flowering strains only should be grown.
7. A fine bunch of the new Sweet Pea Dawn, salmon-pink, flushed orange.

RESTORING THE GARDEN WITH ANNUALS

Ornamental grasses

MANY of the ornamental grasses are well worthy of cultivation, whether for garden embellishment or for cut decoration purposes. Most border flowers are enhanced in grace by arranging some of the feathery and light varieties in the arrangement. Most of these grasses are not too particular as to soils, aspects, or surroundings.

Agrostis nebulosa, a beautiful feathery grass and most useful for bouquets and table decorations.

Stipa pennata (Feather Grass), a favourite border and decorative grass, lending its plumes most effectively in bouquets or Sweet Pea blooms.

Hordeum jubatum (Squirrel's Tail), a fine border grass with flower plumes similar to the tail of a squirrel.

Briza maxima and B. gracilis (Quaking Grass), an elegant and pretty grass, everyone's favourite, and most adaptable for arranging with Carnations and other flowers. Growing about 18 inches high, whilst patches or clumps introduced on bare places in the herbaceous or Rose border always command admiration.

Tricholæna rosea, a pretty grass with spikes tinged with rose and growing about 2 feet high. Will be found charming for table decorations.

Pennisetum longistylum, a perennial grass of great beauty and easily raised from seed. The flower-spikes are feathery and about 24 inches high, whilst their habit is graceful and elegant.

Eragrostis elegans (Love Grass), one of the most useful of all the annual grasses, and valuable for its use in lending a charm and pleasing effect when mixed with Sweet Peas and other flowers of a light nature.

Bromus brizæformis, a useful border grass growing about 12 inches high and useful for vase and table decoration. Will grow in most soils and any situation.

Coix lachryma (Job's Tears), an interesting grass with curious seeds often used as beads.

Chloris barbatus and C. elegans are useful border and bouquet grasses growing about 12 inches high. G. L.

Everlasting flowers

In my early days in the supervision of large gardens one of my most useful ventures was the growing of everlasting flowers, and needless to remark many of these pretty objects were found most useful for winter decoration especially in the nursery or library.

These everlasting flowers were generally cut before being too advanced, and preserved in the fruit room, and bring to mind using Rhodanthe rosea and R. Manglesii as a table decoration on December 18th to seat 35 guests, after a large pheasant shooting. The colour scheme was admired by everyone; the great, late Duke of Cambridge was one of the party, this being about 34 years ago.

The varieties I recommend for cut flower purposes are Rhodanthe Manglesii (rose and yellow), Maculata (rose with dark ring),
Maculata alba (white), and rosea.
chrysum Fireball, Golden Ball, and brac
tum are well known everlasting flowers,
retain their fresh colours for a long pe
Acroclinium roseum, album, and flore
are all pretty everlastings. Globe Ama
thus (white) and the orange-coloured var
Aurantiaca, are worthy of cultivation.

Xeranthemum annuum, various shade
a most useful flower, Statice sinnata,
Suworowii can be added to the everlas
flora, and highly recommended as being
excellence for decorative purposes.

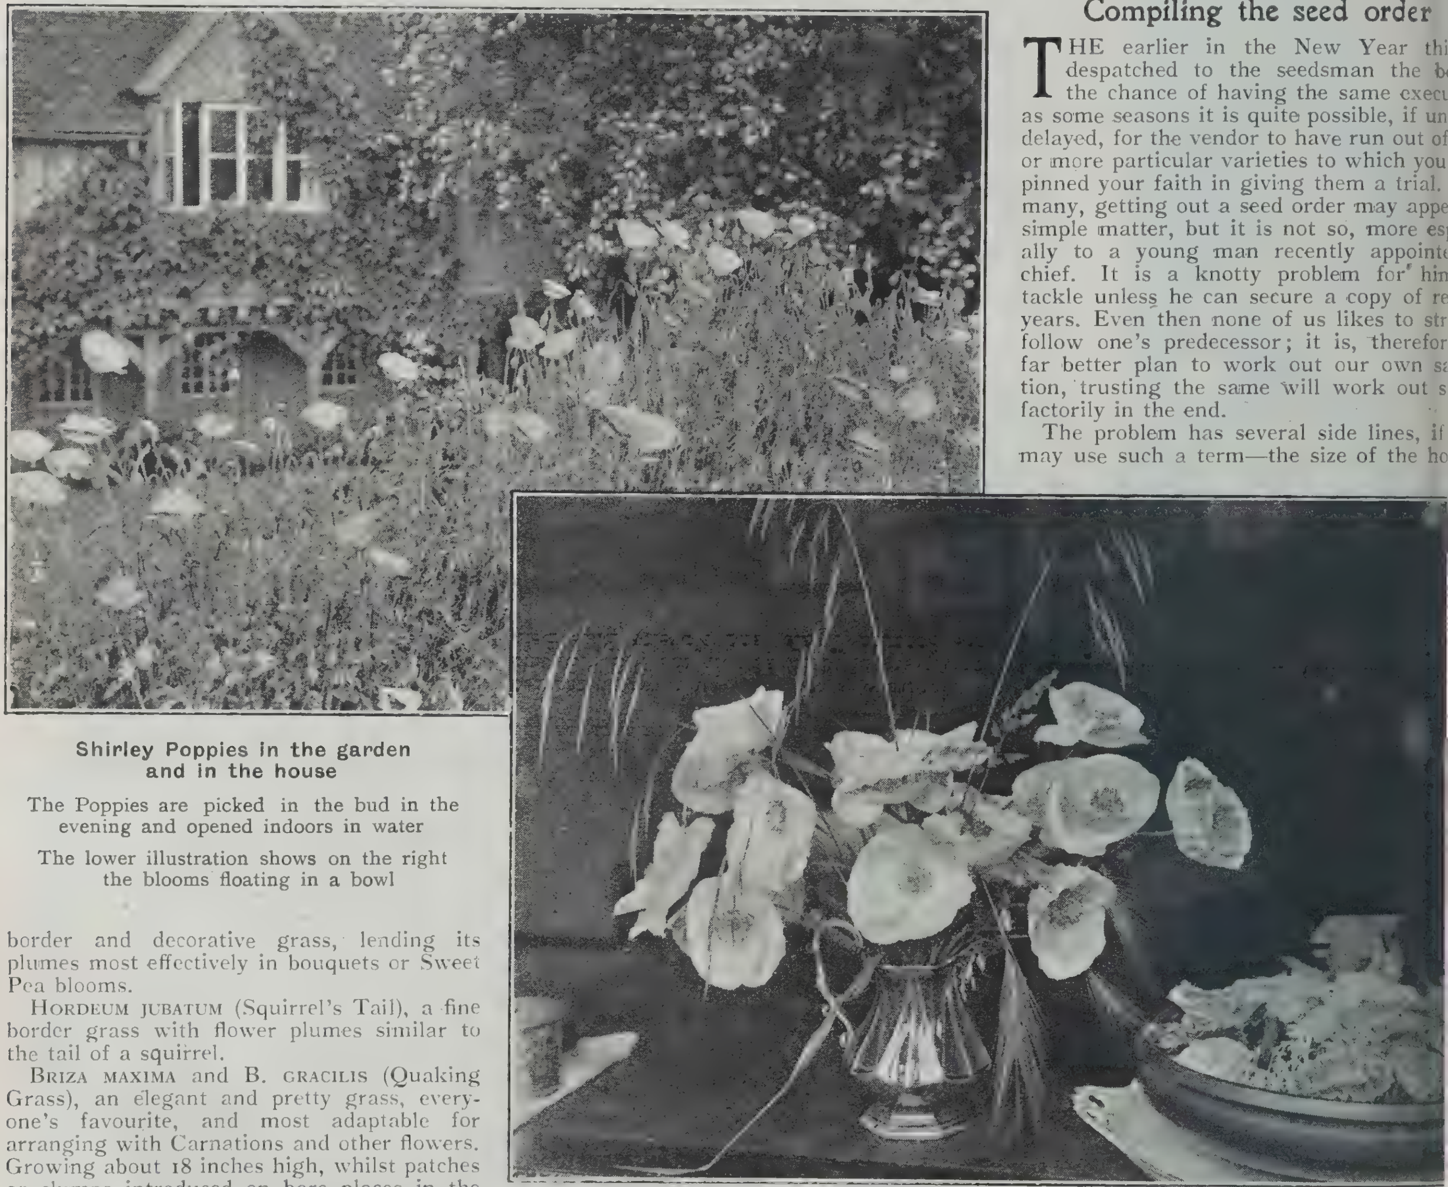
All will thrive in good ordinary ga
soils. G.

Compiling the seed order

THE earlier in the New Year thi
despatched to the seedsman the b
the chance of having the same execu
as some seasons it is quite possible, if un
delayed, for the vendor to have run out of
or more particular varieties to which you
pinned your faith in giving them a trial.
many, getting out a seed order may appe
simple matter, but it is not so, more es
ally to a young man recently appointe
chief. It is a knotty problem for him
tackle unless he can secure a copy of re
years. Even then none of us likes to str
follow one's predecessor; it is, therefor
far better plan to work out our own s
tion, trusting the same will work out s
factorily in the end.

The problem has several side lines, if
may use such a term—the size of the ho
hold, how long such are in residence, o
absent for any length of time, whether
plies are expected to be sent on to them,
finally, the size of the garden for vegeta
and flower seeds respectively, and, as pr
ously remarked, it requires well thinking
before finally committing it to pen and pa

We should also study the soil and situa
we have to contend with, especially in v
table culture, some varieties thriving
while, on the other hand, others may pro
partial failure; and this brings me to
question of novelties. While not in the l
condemning such (if it were not for them
should never make progress), it is decid
best not to rely on them for a crop until



Shirley Poppies in the garden and in the house

The Poppies are picked in the bud in the evening and opened indoors in water

The lower illustration shows on the right the blooms floating in a bowl

d out by testing whether they are suitable
your locality and an improvement on older
rieties. It is only by this method, com-
ned with good culture, you can really decide
nether such have come up to the standard
had hoped for. Men who have had long
perience in gardening know only too well
behaviour of the Potato, giving full satis-
tion in certain gardens, in others, pro-
ly a different soil, proving an utter failure.
obably this vegetable is the worst offender,
edible Peas are frequently known to act
etty much in the same way, so that we
ist study this question thoroughly from
start, and as regards novelties, doubtless
ey have proved them to be a decided im-
ovement on existing varieties, whether it
vegetable or flower. We should still re-
mber that they may prove unsatisfactory
der our culture. It should have been re-
arked earlier in these notes the propriety of
nsulting your employers as to their likes or
likes before filling in the list of require-
nts for the ensuing year; we all of us
ve different tastes as well as ideas. We
ist also study the earliness as well as late-
ss as regards vegetables, especially Peas,
uliflower, Turnips, Potatoes, Cabbage,
d Broccoli. It is galling to be told your
ighbour has gathered his first dish of Peas
cut his first Cauliflower. Earliness is
idied more than lateness by one's employer;
the latter one is at the mercy of the ele-
nts more than early summer, though at
nes we have cause to complain even then.

In the matter of seeds, it is always ad-
able to procure them from a reliable firm
you pay a trifle more for them. You feel
ey are true to name, and can depend, with
eful culture and little details, that germina-
n will be sure. The saving of one's seed
sens the seed order, but it should only be
ictised when the strain is exceptionally
od, while respecting the Potato, it is ad-
able to change the tubers fairly often that
ve been graded for seed purposes, and it is
imed that Scottish seed on its early ripen-
produces excellent crops capable of re-
ting disease to a very great extent; at all
nts, seeds from over the border certainly
ld good crops, choosing immune varieties
possible.

It should be borne in mind better results
rue when crops intended for seed purposes
grown widely apart if their true charac-
is to be maintained. This applies to
wers as well as vegetables. There is a
od deal of labour attached to seed-saving
d needs placing in reliable hands, and,
er all is said and done, it is our duty to
pport the trade as much as we can. They
roughly know their business, and have
ery convenience for cleansing the seed of
foreign matter, which few amateurs have.

J. MAYNE.

axifraga longifolia and S. cotyledon pyramidalis

The two Rockfoils mentioned above are,
my mind, two of the loveliest of the sec-
n. Saxifraga cotyledon pyramidalis bears
bust, erect sprays from 1 foot to 4 feet long,
th crimson-speckled flowers, most useful
cutting purposes or giving effect, most
arming in the garden. A sweet and well-
ained compost must be given to this
serving plant. Saxifraga longifolia,
ghtly termed the "Queen of Saxifrages,"
the splendid acquisition introduced from
e Pyrenees. The large, expanded rosettes
e always attractive, and a well-grown plant
flower, with the large pyramidal truss of
oom, is most beautiful.

When buying, it would be well to order a
o-year-old plant, as the yearlings will not
loom until they have been established a
ason.

G. L.

Outstanding Novelties Among Seeds

PRACTICALLY all the seed lists issued by the leading firms now have a special section devoted to attractive novelties. It would occupy a considerable amount of space to deal with these fully, so that only a few selections are possible.

Of all the annuals scheduled in the various lists probably novelties among Sweet Peas are the greatest in number. Flaming June is a fine scarlet-cerise which revels in the strongest sunshine and does not show any inclination to burn. It received an Award of Merit and was reserved for the Gold Medal for 1929 at the trials of the N.S.P.S., 1928. Both for exhibition and garden decoration it is an outstanding novelty. This is one of the novelties listed by Carters.

Sweet Pea Flaming June—a fine scarlet-cerise, reserved for the N.S.P.S. Gold Medal, 1929

Sutton's Scarlet Glow, Dawn, and Pink Delight are three excellent new Sweet Peas from Reading. They are all first-class varieties for exhibition. Dawn is a particularly vigorous salmon-pink and is said to be the strongest grown of this colour.

Montrose, a solid rose-pink, which secured an Award of Merit at both the N.S.P.S. and the Scottish Trials, and Novelty Blue Bell, said to be the finest blue Sweet Pea, are two attractions offered by Bolton and Son.

Among the novelties listed by Unwins are a dozen choice varieties of special merit, the outstanding one of which is, perhaps, Mrs. A. Searles, a new shade which might best be described as warm cerise-salmon with a golden glow. It is a most charming colour both by day and artificial light. Toogoods include some attractive new varieties, among which are Huntsman and Tom Webster, both of which secured Awards of Merit. The first is a rich shade of scarlet and the other a medium deep blue. Robert Sydenham, Ltd., have a dozen novelties the merits of which are detailed in their list.

Among Gaillardias is The King, which Ryders are offering. The flowers are immense and wonderfully brilliant. It blooms over a long period and is very conspicuous.

G. grandiflora Portola Hybrids is a new strain which bears flowers of a very large size, ranging in colour through the shades of bronzy-red. It has the robust origin of the well-known Portola variety. This latter is listed by Toogoods. Webbs, of Stourbridge, are now offering their new Sunshine Aster, a most attractive variety which is worthy of special notice.

J. R. Pearson and Sons, Ltd., tell us they have now a seed farm in Essex where they are growing highly selected stocks of vegetable and flower seeds. Sweet Peas are receiving special attention, and the crop in 1928 was a particularly good one. Mr. A. J. Pearson is managing this Essex farm, and during the few years he has been at the work he has already made great improvements upon many stocks of flower seeds. No less than seven pages in Dobbie and Co., Ltd.'s, catalogues are devoted to seed novelties of various kinds, and they include some very distinct strains, many of which are a great advance on old varieties and are, therefore, worth attention.

Ryders are offering seeds of Adonis Aleppica The Flame of the East. It is a glorious subject of a vivid colour, almost the shade of Anemone fulgens. The flowers are from 2 inches to 2½ inches across, of the same shape as Cosmos, and are splendid for cutting. Best results are secured by soaking the seed for four to six days, then sowing in light soil without allowing them to dry.

Narcissus Dawn (N. poeticus x triandrus) in the rock garden

Among vegetables, Webbs' new Macbeth Castle Potato has a combination of qualities which put it in the foremost rank. Ryders' Golden Wonder is a new dwarf French Bean the pods of which are long, fleshy, stringless, and of a delightful golden colour. It is an excellent cropper and particularly early. Carters have renamed their Solid Giant Tomato Carters' Fruit Tomato, as the flesh is more solid than last season's selection. It is said to peel like a Peach, and can be eaten raw like an Apple.

Some new and noteworthy flower seeds for 1929

MANY garden lovers are now on the look-out for some novelties and little-known plants which may be raised from seed, and already many seed lists are being distributed. Those who do not mind some trouble and are willing to wait for results can obtain many well-known Lilies from seed and also a large number of Irises. The seed of the very best-named Delphiniums can also be purchased, and some of the resulting seedlings may possibly eclipse the beauty of their parents.

In choosing our seeds those suitable for the rock garden should not be forgotten, and amongst those suggested for sowing in it the following are given:—The Violet Cress (Ionopsidium acaule), most useful for quickly clothing bare spaces and doing well in the shade. For growing in full sun we have the beautiful Portulacas and Phacelia campanulata, with its Gentian-blue bells. Then we have the dwarf Linarias, Meconopsis cambrica, Cheiranthus Allionii, Erinus alpinus, Silene alpestris, and many other small annuals, which will give colour and interest to the rock garden after Alpine perennials and early-flowering bulbs are over.

The Dianthuses are particularly suited for a place here, and one of the most easy to raise from seed is D. Hybridus Highland Queen. It produces a succession of large crimson flowers over a long period. Most of us are familiar with the old Gilea tricolor; Gilea Californica is also offered. After having been nearly lost to cultivation it has been introduced again. It grows about 3 feet high and bears handsome spikes of pink flowers. It is best raised from seed sown under cover in the early autumn and planted out in its flowering quarters early in the following summer. Another delightful plant shown as a novelty at the last R.H.S. "Chelsea" is the Ranunculus Lyalli, native of New Zealand (see illustration, page 36). It throws up glossy leaves and a stout, branching stem bearing a number of many-petalled flowers of ivory-white with striking golden anthers. The fleshy rhizomes of this plant made it most difficult to import, but when raised from seed fine specimens may be obtained. It should be grown in light, well-drained soil and in partial shade.

Among the many interesting species of the Primrose family the giant Primula Florindæ, discovered by Capt. Kingdon Ward in Central Asia, must certainly be noted. It attains 3 feet or more in height, and in July and August bears as many as 60 to 80 yellow pendant blossoms. Primula malacoides Snow Queen is a fine new variety bearing more numerous and larger flowers than old alba. Primula anisidora is of japonica type, producing blossoms as l as a sixpenny bit in whorls of a rich mar crimson tint. It is said to be of quite culture. Primula Burmanica bears wh of still larger flowers of a rosy-purple sh

We make no apology for mentioning name of the incomparable Meconopsis Bail which was one of the outstanding feat of 1928. This lovely plant, discovered Kingdon Ward in Thibet, is certainly on the finest additions to our garden plant recent years. We may surely be excused again drawing attention to a last ye novelty, the great Guatemala Dahlia, Maxoni, which attains the height of 10 and produces a dozen rosy-lilac flowers expanding together on the same st Gentiana Farreri, with its lovely Cambri blue flowers, must also be noted.

Some years ago a fine Calceolaria nar Albert Kent was sent out, and we have offered us the Albert Kent Hybrids, in wh there are a dozen or more different col ings. The plants produce large trusses blossom and are most useful for indoor outdoor decoration.

We also have some new Eschscholtz The drawback to the older varieties their straggly and untidy habit of grow but Enchantress is a variety with double crimson flowers on a compact, erect-grow plant. Buttercup has the same habit growth, with double yellow blossoms, Moonlight is another charming yell flowered variety.

The fine Feltham strain of Orier Poppies are well worth growing from se There are no black blotches at the base the petals, and the great globular blosso are of many delightful soft colourings va ing from pink, salmon, apricot, to oran scarlet, and crimson. Lupins are also lightful things to raise from seed, as th are so many colours to be found amon them. Last, but not least, we have our friend, the Pot Marigold, introduced to in a new form, for in Calendula officin flore-pleno Radio we have a wonder quilled flower giving quite a different appe ance to the blossom to those of the type. is a novelty that will very soon attain gr popularity.

The double-flowered Wallflower Ea Wonder can now be obtained in all colours of the old double Wallflowers, and sown in the autumn they will begin blo ing in four or five months, and success sowings should be made. This strain is result of a cross between the old dou flowered varieties and the Paris ann Wallflower. These are but a few of plants to be raised by seed listed amon the best novelties of 1929, and the list mi be very greatly extended; but in conclus we should like to mention the beauti Chinese Aster Delavayi, with its gr lavender-tinted flower.

Sweet-scented flowers

Garden lovers are in the minority who not acclaim their choice for scented flowe

The following kinds and varieties grow in any garden, whilst the pleasing f grance of various degrees should satisfy most fastidious.

Schizopetalon Walkeri, a beautiful annu and as a cut flower subject is well worthy cultivation; flowers white, fringed, nig scented, growing about a foot high.

Matthiola bicornis (Night-Scented Sto should be sown in patches, when the night will be permeated with a delightful perfum

Mignonette Orange Queen, Goliath, a Miles Spiral will be found some of the b rieties to introduce to the borders and ds, also for cut flower purposes.

Dracocephalum Moldavicum produces long kes of violet flowers, bushy in habit, and a y compact plant for the border.

ilia Snow Queen, a useful, fragrant riety, continuing in bloom a long time, and request for cutting purposes.

Silene Armeria (spice-scented) and Silene entalis (clove-scented), growing about 12 hes high, and known as Lobel's Catchfly.

Hesperis and its varieties are useful to w for their fragrance and use for decoran; commonly known as Sweet Rocket.

Centaurea moschata (Sweet Sultan) The idegroom, a lovely flower for cutting purses, the colour being a lovely heliotrope, th a delightful fragrance. This Sweet ltan is worthy of a place in every garden, matter how small.

Erysimum Peroffskianum, a showy cut-wer annual, producing flowers deep orange colour, growing about 15 inches high, with fragrance most pleasing.

Malva moschata, a useful plant for out-the-way corners or poor soils, its pretty wers of rose pink being very effective in ces where flowers are least expected to ive. There is a white form of the above ich can be associated with it in growth.

G. L.

Daffodils for the rock garden

F we except the well-known miniature species and wild forms of Narcissus it is very difficult to find any that are of a size fit in with the rightful inhabitants of a all rock garden. Even the beautiful tural hybrid, Queen of Spain, looks like lliver among the Lilliputians when towerg over a colony of Kabschia Saxifrages. e Hoop-petticoat and triandrus forms are t always easily pleased with the lodgings ovided for them, and tend to die out rather an increase.

The best of all to associate with the choice gmy population of the scree bed (*née* oraine) is the Pyrenean N. juncifolius. ould that others possessed such slender sh-like leaves, such dwarf flower-stalks, d also rejoiced as freely in the sharp draine and summer ripening provided by the tty soil! I find under such conditions it ds itself about freely. On larger ledges half-shade, where such plants as Anemone nda, Hepatica, and the choicer forms of morosa are at home, a little irregular oup or drift of a taller Daffodil would be ll placed. Nothing better could be chosen n a beautiful cross between a poeticus m and N. cyclamineus raised by Mr. P. D. illiams and named Beryl.

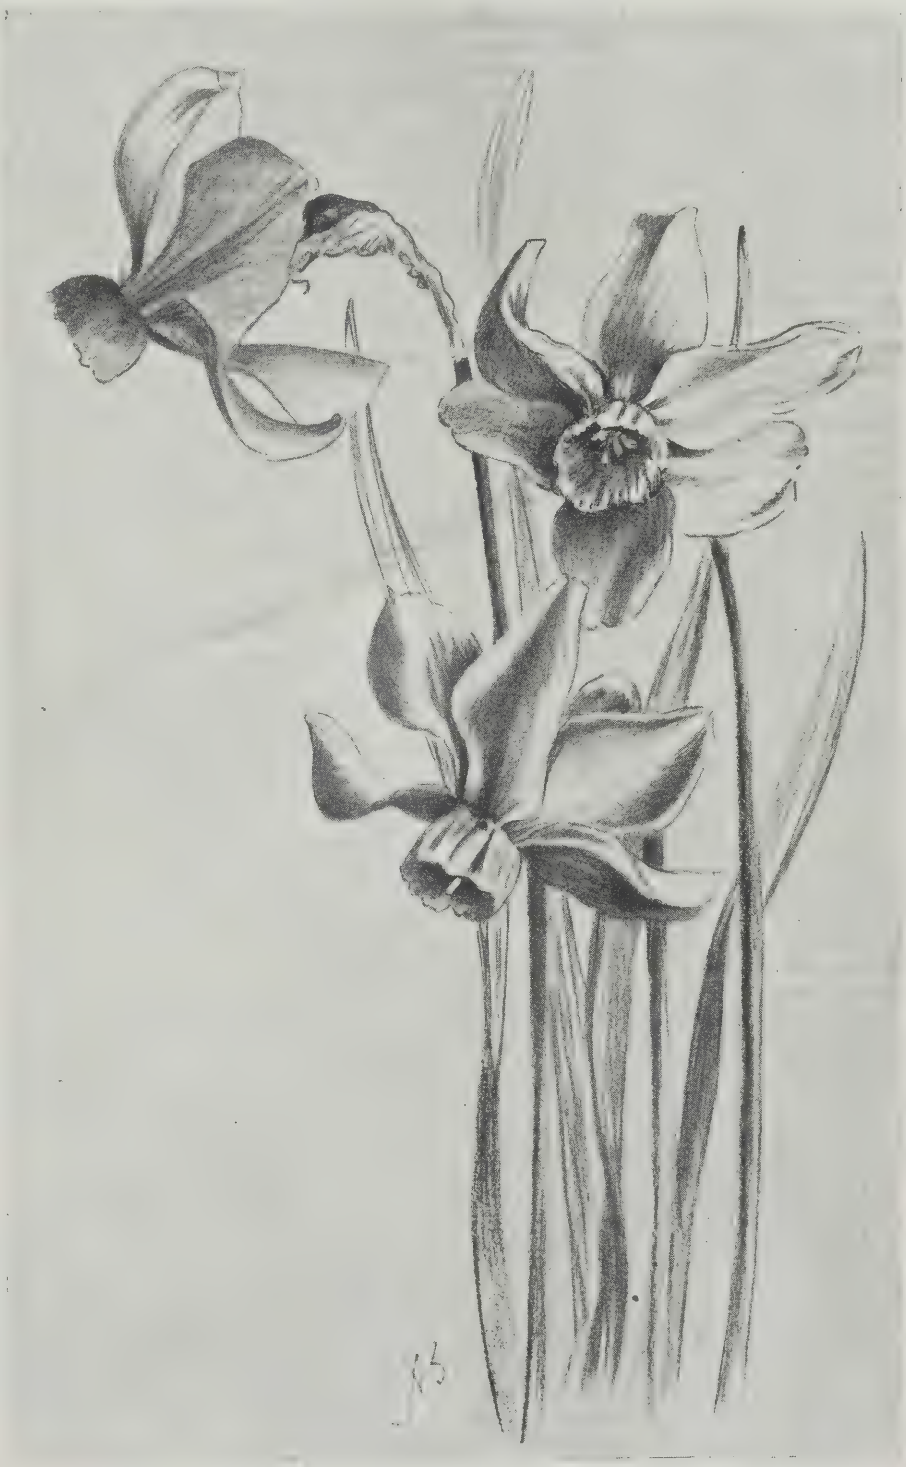
The charm of a recurved perianth is inrited from cyclamineus, but the kicking-rse expression of that parent has been anged into a graceful curve more like that a Turk's-cap Lily. Poeticus blood (or ght we not to say sap?) is shown in the ndness of the perianth segments and also orange rim of the cup. When freshly ned the flowers are of a clear, bright low, which grows paler day by day, and, frosts are about, more rapidly night by ht. Even in those springs which are so ing to Daffodils, when hot days succeed d nights, this growing pallor of Beryl does look faded, or "over-worn" as Parkinn would have written. Both growing on plant and cut for a small vase, the const of the bleached, older blooms with re recently opened and brighter ones is y pleasing, and as Beryl inherits the long al life of cyclamineus it is good to see a fortnight or more both in the garden d house.

E. A. Bowles.

Cotoneaster humifusa

There is a wonderful wealth of material for the garden among the Cotoneasters, but much of it remains unrecognised. They vary from little creeping shrubs to tall, tree-like plants such as C. frigida. For the rock garden or bank where there is plenty of room C. humifusa is a species of notable merit. It is not recommended where space is limited, but there are many gardens with large rocks or bare banks, where its presence would be a decided acquisition. It is a very low-growing species, rarely rising more than 6 inches above the surface of the rock, but forming a big prostrate mat of much beauty. The shining leaves are evergreen, and in late spring or early summer it bears a number of white flowers, which are succeeded by berries of coral red. I have in my garden one plant trailing over large stones close to a moraine, and another occupying a similar position in the rock garden, and this Cotoneaster attractive in both. C. humifusa is hardy, and is not at all particular as to soil or position. It is increased by cuttings or by berries.

S. A.



[*From a Drawing by E. A. Bowles.*

Beryl

Winter flowering Begonias

All Begonias should be cut back immediately their flowers are over and placed in a cool house. The plants should be kept on the dry side and as close up to the glass as possible. Syringing between the pots occasionally will encourage the development of sturdy young growths, which will be needed for cuttings later.

REMINDERS FOR THE WEEK

Southern and Midland

Shrubs for forcing

These may now be introduced to gentle warmth, a temperature of 45 degs. to 50 degs. being ample for the first 10 days, following which a gradual rise may be given until 60 degs. has been reached. To force unduly is to render the buds of Azaleas and Rhododendrons blind, and even those subjects which do respond to high temperatures are miserable specimens compared with those brought along more naturally. In addition to the above the following are very desirable for indoor decoration when forced:—Prunus triloba flore-pleno, Lilacs, Genista fragrans, Staphylea colchica, Deutzia gracilis, Magnolias, Wistaria sinensis, Cytisus Andreanus, Hydrangea paniculata grandiflora, Viburnum opulus sterile, and V. plicatum. As the plants begin to show colour they should be removed to cooler quarters, where their colour and strength will develop more prominently.

Arum Lilies

Strong and well-established plants which are now developing flower-spikes will benefit greatly from applications of diluted manure-water. These respond to gentle forcing freely, and where quantities are grown it is advisable to introduce them in batches, reserving a few at least for use during Eastertide, when their fine blooms are so precious. Such as these must be kept in a cool greenhouse temperature of about 45 degs. to 50 degs.

Lily of the Valley

Pot up retarded crowns every fortnight and so keep up a constant supply of cut bloom. These take about 21 days to force into bloom, but it is always advisable to allow the plants a week at least in a cooler temperature before cutting, as the leaves become greener and harder, and the flower-stems longer and stronger, enabling them to stand much longer—whether as cut flowers or otherwise—in rooms.

Bulbs for forcing

Remove these from the plunging ground when their growth is seen to be from 2 inches to 2½ inches in height, and place in cool frames for the time being; expose to the light gradually and give air freely after the first week. In about 10 days some of the earliest kinds may be placed in the forcing-house, and from this date no difficulty should be experienced in maintaining a constant supply of bloom. Though not generally grown in this way Friesias do remarkably well when started beneath a bed of ashes, such as are used for Tulips, Narcissus, etc.

Fruit trees

Planting should only be carried out when the soil is in good working order. Positions, however, may be prepared beforehand, the ground being trenched to a depth of 3 feet. All poor material should be cast aside and good fresh loam brought in where required. No manure should be used, but it is necessary to make up the stations with a good substantial loam, as such positions, once prepared in this way, will require no further attention for several years. Bring forward planting arrears on all convenient occasions, although there is still much time ahead for planting fruit trees and bushes.

Raspberries

Examine the supports of these, making renewals where necessary, and at the same time the future netting of the canes should not be lost sight of, and if the supports are carried a foot or 18 inches higher than required for the canes and a wire strained from post to post netting is quickly accomplished at a time when every hour is precious. Thin out the canes finally to about 1 foot apart and tie firmly those remaining. Apply a dressing of well-matured farmyard manure and no further care will be required until the spring.

Spring Cabbage

These are very promising, and an opportunity should be seized when the soil moves freely to draw up a little around the stems to prevent the plants being twisted by rough winds.

Hardy Lettuce

Stir up the soil between the plants so as to encourage a stocky hard growth, and at intervals dust a little soot and lime between the plants.

Vermin

During the long dark hours much damage may be done to bulbs and other choice subjects by mice and rabbits. I recently discovered mice stripping both leaves and flowers from a specimen of Clematis Forrestii. Trapping must be freely indulged in. E. MARKHAM.

Gravetye Manor,
East Grinstead, Sussex.

Scotland

Spring Cabbages

As soon as the soil gets into a workable condition the autumn-planted Cabbages should have attention. Remove any dead foliage and then well break the surface with a Dutch hoe. A dusting under the plants of lime is not only excellent for discouraging slugs and other vermin, but is, also, good for the Cabbages. To ensure a succession to these autumn-raised plants a small sowing of some fast-growing variety, like Dickson's First and Best, can be commended. Sow in a box and set in a very gentle warmth.

Earliest Peas

Where space is available, say, in a Peach-house, a sowing of Peas may now be made in boxes or pots. To encourage sturdy, firm growth a minimum of fire heat only must be given, for to force on growth at this season is to ask for trouble later. Look out for mice, these little pests being very partial to the seeds of Peas of all kinds.

Prepare ground for Asparagus

Should it be contemplated to lay down fresh beds of this esteemed vegetable it is important to have the site for the new beds thoroughly prepared some time in advance of either sowing or planting. A generous supply of well-rotted farmyard manure should be given and the ground either trenched or double-dug, leaving the surface as rough as possible to permit of the sun and frost pulverising and sweetening it to as great a depth as possible.

Maincrop Tomatoes

Very early sowing is seldom advisable except for the raising of a few plants to provide a few early fruits, as, with the short, sunless days, the growth is, usually, lanky and long-jointed, with, of course, a rather sparse crop. By sowing from now on till the end of the month the little seedlings, when they appear, have the benefit of more daylight, and, with the spring "feel" in the air, make much sturdier and more fruitful plants. A temperature of about 60 degs. is necessary if good results are to be looked for.

Sweet Peas

The sowing of full stocks of this pop
annual should now be proceeded with,
even for garden decoration and the pro
tion of cut flowers for house adornmen
pays to raise the plants under glass. St
heat is neither necessary nor advisab
house or pit having a temperature of f
50 degs. to 55 degs. suiting admirably,
even a cold frame gives excellent res
although, of course, germination is m
slower. Good but not unduly rich
should be provided, and either boxes or
used. The former are least trouble, and
quite satisfactory results.

Lobelias from seed

The dwarf bedding Lobelias, when ra

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

ORCHIDS

Lycaste Skinneri

Quite a small plant of Lycaste Skinneri has thrown up six spikes of bloom from one bulb only, one spike being fully out at the present time. Do you consider this number too many for a small plant having two back bulbs only, and would you advise taking any away so as not to weaken the plant for blooming another year?

Esher. SUBSCRIBER.

[For a small plant there are too many blooms, but their presence shows your treatment is right. Cut each flower after it has fully opened. They will last well in water, and you will have the pleasure of them without stressing the plant. When larger the plant can bear six or more blooms from one bulb with impunity.]

Dividing Cypripedium insigne

I have several large pots of Cypripedium insigne which have all bloomed fairly well this year. One of these plants is getting very large, and must measure almost 2 feet across, and I am rather inclined to divide this large plant, and should be glad to have your opinion regarding soil and time to divide. These plants are growing with a various collection of other plants in a winter temperature of not less than 50 degs. to 55 degs.

Esher. SUBSCRIBER.

[The better time to divide the plant with your temperature would be in March. With 60 degs. division and repotting could be effected now. For compost use three parts good fibrous loam from which all the fine soil has been well sifted, one part of good peat or Osmunda fibre—the better material—and Sphagnum Moss chopped into inch lengths. Add finely broken red brick or potsherds, more or less according to the retentive nature of the loam, but sufficient to keep the compost sweet and open. Mix well together. After repotting do not water for two or three days.]

GREENHOUSE

Cyclamen maggot

(B. A. Wolryche-Whitmore).—The control of weevil maggots at the roots of Cyclamen is difficult. You might try the effect of giving a very light dressing of powdered naphthalene to each pot and then watering it in. These maggots eventually become weevils, and when in this stage should be trapped by placing loose heaps of hay about the places which they frequent. Soil treatment for infested pots is at present very largely experimental. Worms in flower-pots can be removed by watering the infested pots with clear lime-water. To prepare this solution take 1 lb. of good lump quicklime and add enough water to slake it, then add a little more water to make the slaked lime into a paste; finally add 10 gallons of water and stir well. Allow the mixture of lime and water to settle down, and pour the clear liquid into another container. Water each plant infested with worms with the clear lime-water, and when the worms come to the surface they should be removed by hand and destroyed. Repeat the watering with clear lime-water as often as is necessary to obtain control.

Unsatisfactory Poinsettias

I should be pleased if you could tell me why my Poinsettias did not flower properly (about half to what they should). I cut down the old ones February, 1928, and grew them on the single stem, also had some young ones when cuttings were produced. The soil for final potting (6-inch pots) consists of one-half loam, one-quarter leaf-mould, one-quarter horse droppings, sand, a dash of soot, and bone-meal. I gave them plenty of air through August to harden and put them in the intermediate-house (heat 55 degs.). During the second week of September I gave them a pinch of artificial manure and watered twice with soot-water. The plants made growth (7 feet to 8 feet) with stems thicker than one's finger (large). After making such growth I expected them to produce bracts, but was disappointed. F. E. F.

[The plain truth is that your Poinsettias have been much too liberally treated. This has caused them to grow over-luxuriantly, and, as a matter of course, the bracts have been spoiled. In future omit the stimulating materials, such as horse droppings or artificial manures, in the compost at all stages. Good turfy loam three parts, leaf-mould one part, a little sand, and some mortar rubbish ought to suffice until the bracts are well developed. Afterwards weak liquid-manure or half an ounce of any good chemical fertiliser dissolved in a gallon of soft water and applied twice weekly would assist in the development. Pots 5 inches and 6 inches in diameter are quite large enough, otherwise the treatment afforded to the plants could not be improved upon.]

FLOWER GARDEN

Making an herbaceous border and shrubbery

I am making a new herbaceous border about 50 feet by 8 feet, also a shrub border about 56 feet by 10 feet, and shall be glad to know about how far apart in each case the plants should be put. A. M. B.

[It is impossible to answer this question without knowing what shrubs and plants are to be used. Various shrubs require to be spaced from 1 foot to 8 feet apart, and border plants may need anything between 6 inches and 18 inches. The shrub sent for identification is a Pernettya, a very useful dwarf shrub, especially in light soils. The one most commonly grown is P. mucronata, commonly known to nurserymen as P. speciosa. It has red berries. Some varieties raised some years ago by a nurseryman in Ireland, known as Davis's berried Pernettyas, are much to be recommended. The berries are larger and more numerous, and are in a variety of colourings—red, white, and pink; all desirable.]

TREES AND SHRUBS

Raising Spruce Firs

(Spruce).—Spruce is always raised from seeds, but unless a large number is required it is more profitable to purchase such than to raise seedlings. The work in connection with the latter method entails a considerable amount of labour. Briefly, prepare a bed 3 feet 6 inches in width and as long as may be necessary. Dig deeply, pulverising the soil very thoroughly, then throw 4 inches of the surface soil to either side of the bed, afterwards rolling the latter with a fairly heavy roller. The seeds may then be sown broadcast and covered lightly with the soil which was removed. Rake the surface smoothly. It is advised that the seeds be damped and well coated with red lead before sowing, and if the bed is accessible to rabbits it is necessary to enclose it with wire netting. The seedlings will not be ready for transplanting for two years, as, in its early stages, Spruce is rather slow in growth. Sitka Spruce grows more quickly than the native sort. The seedlings must be kept absolutely free from weeds at all their stages. Seeds may be procured (the price varies from year to year) from Little and Ballantyne, Carlisle; Ben. Reid, Aberdeen; Learmont, Hunter, and King, Dumfries; while several of the Copenhagen dealers are willing to supply seeds in bulk. Probable price, from 7s. 6d. to 10s. per lb.

Bullfinches and buds

I should be so grateful for some hints as to how to prevent bullfinches destroying flower-buds on Prunus Pissardii trees. Every year about this time they are literally stripped. Bushes are much too tall to spray, and we have tried tying rags on, without much success. MRS. A.

Co. Cork.

[As your bushes are too tall to spray, it would also be impossible to dust them with soot or with a mixture of soot and freshly slaked lime, which would discourage the bullfinches. The only other remedy which can be suggested is the use of the gun. This is always to be regretted where birds are concerned, but when the latter become pests they must be treated as such. Have some cartridges loaded with snipe-dust, or, as some call such fine shot, "sparrow hail." The offenders will realise that the bushes are forbidden territory.]

FRUIT

Forcing Strawberries

(Anxious).—The correct method of forcing Strawberries is to place the plants over a bed of moist and slowly fermenting leaves in a sharp-pitched house or Melon pit, where they can be kept close to the glass. The Strawberry is a moisture-loving plant, and careful watering is imperative, especially at this season when moisture can be overdone. Careful watch must be kept for Red Spider, Aphides, and mildew, all of which may be troublesome in the case of forced Strawberries. The temperature at the outset must not exceed 40 degs. to 45 degs. by night, with a rise of 5 degs. to 10 degs. during day. No hard-and-fast rule can be laid down, as it sometimes happens that 40 degs. at night may be succeeded by 55 degs., or even 60 degs., on mild days. Turn over and renew the fermenting leaves occasionally, and when the plants are in bloom fertilise the latter by using a camel-hair brush or a rabbit's tail. When the fruits begin to swell use weak liquid-manure judiciously, stopping supplies before the fruits take on colour. Strawberries are often started in early Peach-houses and vineries. To force Strawberries successfully is not the simple matter which, to many, it appears to be.

VEGETABLES

"Pithy" Celery

(Regular Reader).—Nothing so much tends to make Celery "pithy," or pipey-stemmed, as neglect in its earliest stages. By neglect is not, in this instance, to be understood as carelessness or lack of attention, but simply, as not infrequently happens, that the seedlings have been left rather too long in the seed-pan before being pricked off. Celery seeds are, as a general rule, sown very much too thickly and, as the percentage of germination is usually high, the seedlings become congested and their roots intermatted. The check experienced when they are pricked off invariably leads to hollowness in the footstalks when the plants attain maturity. Otherwise your procedure is unchallengeable. This year try the effects of sowing very thinly, and prick off the seedlings as soon as they have made their first pair of true leaves. Do not use soil of a too rich description when handling the seedlings, but, if grown in boxes, a layer of well-rotted manure may be laid in the bottom of each box.

LEGAL POINT

Wages in lieu of notice

I would be very glad if you would enlighten me on the following matter:—When men are paid at an agreed rate "per day" (paid fortnightly) are they entitled to a fortnight's wages in lieu of notice? R. H.

[If a gardener is hired by the day he is not entitled to any notice, but if the hiring is by the week or the fortnight it must be a matter of arrangement. A general hiring of a gardener (not a labourer) to be paid every fortnight at an agreed rate of so much per day would, in the absence of any arrangement to the contrary, carry the right to a month's notice, that being the custom in regard to domestic servants, but day labouring is different.]

MISCELLANEOUS

Potash fertilisers

(J. A. Lane Allman).—Sulphate of potash should be applied to fruit trees at the rate of $1\frac{1}{2}$ ozs. per square yard, $2\frac{3}{4}$ lbs. per square rod or perch, 112 lbs. per rood, and 4 cwts. per acre respectively. We do not think that you need worry about the actual area to be dressed, because if the roots are not in the soil now they will be extending each year, and if the whole area is dressed the potash will remain in the soil and be available as required. The dressing of potash should be applied yearly in March. If you have single trees and you dressed 12 square feet with the tree as centre you would require $1\frac{1}{2}$ lbs. per tree. The area to be dressed could be extended each year.

Canadian Flea Beetles

I would be much obliged if you could advise me how to control the Flea Beetle. For the last two years it has been a very serious pest in this district, and only a few very strong Cabbages have survived to grow to maturity. W. B. M.

Galiano Island, B.C., Canada.

[The methods of control adopted in this country for Flea Beetles are as follows:—(1) Various devices are adopted for taking advantage of the fact that Flea Beetles jump when disturbed. One such device is a pair of wheels connected by a cross-bar or axil, and from the axil is hung a tarred sack. This device is made so that it will run over two or three rows of plants when in a fairly dwarf state. The sack must just touch the
crop so as to make the creatures jum

By Appointment.

LAWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS'
LAWN GUANO
(A Compound Fertilizer)

The safest dressing for turf. It feeds the turf over a long period and will not burn or discolour the grass. Lawn Guano quickly strengthens the roots and encourages a dense growth of fine grass. As used by important clubs and municipalities. Apply now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.

Prices, in Bags: 7 lbs., **3/-**; 14 lbs., **5/-**; 28 lbs., **9/-**; 56 lbs., **15/-**
1 cwt., **25/-**. Carriage paid.

FISONS'
LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed, such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.

Prices, in Kegs: 14 lbs., **5/-**; 28 lbs., **9/-**; 56 lbs., **16/-**;
1 cwt., **27/6**. Carriage paid

FISONS'
BASE FERTILIZER

should be incorporated with the soil before sowing grass seed. Specially prepared to promote strong root growth and give new grass a good start. Use 4 ozs. to the sq. yd. a few days before sowing the seed.

Prices, in Bags: 7 lbs., **3/-**; 14 lbs., **4/6**; 28 lbs., **7/6**; 56 lbs., **12/6**;
1 cwt., **20/**. Carriage paid.

FISONS'
GRASS SEEDS

are the finest procurable, being specially tested before selection.
Special Mixture (for Bowling and Golf Greens, finest grasses only).

Prices, in Bags: 7 lbs., **15/6**; 14 lbs., **30/-**; 28 lbs., **58/-**; 56 lbs., **110/-**;
1 cwt., **210/-**. Carriage paid.

Insurance
against poor fruit!

The fine crop promised by a blossom-covered tree will never mature unless insect pests are controlled

For good, sound fruit and plenty of it, spray your fruit trees and bushes with Agrisol A. Poor crops and unsound fruit are caused by insect pests being left to reach maturity. Most pests are in the egg stage during the winter months; *Agrisol A sprayed on the trees will exterminate them.* Further, this treatment clears the bark of lichens and mosses, and greatly increases the vigour of the trees. Apple, pear, plum and all fruit trees, currant bushes, etc., respond to Agrisol A treatment. But don't leave spraying too late.

REE: A Booklet containing full descriptions of Fruit Tree Pests and their ctrol, sent free on application to the Sole nufacturers:

OLIGNUM LIMITED
25 Borough High St., London, S.E. 1

risol A is packed in all sizes from ½ pint to 1 gallon. The average fruit t e requires ½ pint.

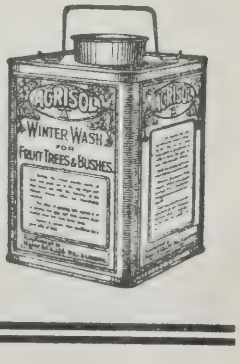
WINTER WASH FOR ALL FRUIT TREES



AGRISOL
WINTER WASH FOR FRUIT TREES & BUSHES

also appear in that journal on research work carried out at the Lea Valley Experimental and Research Station and the John Innes Horticultural Institution. The "Journal of Pomology" can be obtained from Headley Bros., 18, Devonshire Street, Bishopsgate, London, E.C. 2, at 25s. post free per annum. Mr. Grubb's paper on "Potash Fertilisers on Apple Trees" was published in the "Journal of Pomology," Vol. VII., Nos. 1 and 2, page 32. A single copy of this double number can be purchased for 15s. from Headley Bros.]

Shoddy

(M. V. Brown).—A shoddy containing 5 per cent. nitrogen should be applied at the rate of 5 cwts. per rood. If a higher grade material is used half this quantity should be sufficient. The method of applying shoddy is to spread it on the surface of the soil and dig it in. Shoddy is practically useless applied as a top-dressing. The earlier in the winter the shoddy is applied the better, but if for any reason the application has been delayed spring application will do, provided the material is well buried. We will deal with this question in more detail at a later date.

SHORT REPLIES

Strix.—Seed of Oxalis corniculata (purple-leaved) is offered by Messrs. Thompson and Morgan, seedsmen, Ipswich, in 3d. packets, postage 1½d. We do not know of any firm specialising in ornamental foliage Geraniums, and think you will find it difficult to get rooted cuttings or plants of Pelargonium (not Geranium) tricolor from the plant trade, and advise a "Wanted" advertisement in GARDENING ILLUSTRATED. We know the plant is still grown in some private gardens, and someone may be pleased to sell or exchange a few young plants.

A. Sadler.—Seeds of Cynoglossum nervosum are offered by Mons. Henry Correvon, Chêne-bourg, Geneva, Switzerland, at 10d. per packet.

NAMES OF PLANTS

Forest.—1, Erica lusitanica syn. E. codonodes; 2, Pieris floribunda syn. Andromeda floribunda; 3, Ceanothus rigidus; 4, Choisya ternata (Mexican Orange Flower).

G.—1, 2, 4, and 5, Skimmia japonica; 6, Leptospermum, possibly Nichollii; 7, better example required; 8, Ilex altaclarensis; 9, Azalea, cannot name without flowers; no number, Skimmia japonica var. Foremani.

NAMES OF FRUITS

W. G. C., Ascot.—Apple Golden Spire (small fruits).

J. C. G.—1, Mother Apple syn. American Mother; 2, Pear Bergamotte d'Esperen; 3, Apple Lord Derby.

TRADE NOTES

Maintaining drives

Under the title of "The Surface that Survives" Colas Products, Ltd., 38-9, Victoria Street, London, S.W. 1, have issued a well-illustrated and informative booklet dealing with the problem of maintaining drives and paths under modern traffic conditions. The pictures are of drives laid down at Highclere Castle, Alnwick Castle, Westonbirt School, the Zoo North Entrance, and other important sites. Full particulars of "Colas" and its various applications are given, together with a list of notable users and many testimonials. Applicants for this booklet should quote reference N.C.A. or mention GARDENING ILLUSTRATED.

A gnomish gift!

We have received from Mr. A. H. Moorton, of 17, Eccleston Street, S.W. 1, a little gnome-like figure in red, blue, and brown, representing a twig-gatherer, complete with stick and basket, which would make a desirable ornament for house or garden. Mr. Moorton has a large selection of these figures, which are now much in vogue, and they certainly make an attractive splash of colour in the garden besides giving especial delight to the children. Mr. Moorton is a specialist in garden ornaments of all kinds, and is the designer of bird nesting-boxes, which are specially approved by the Royal Society for the Protection of Birds.

Manchester and North of England Orchid Society

At the meeting held on Friday, January 4th, the members of Committee present were Messrs. Hy. Astley Bell (in the chair), J. B. Adamson, A. Burns, A. Coningsby, A. Keeling, D. McLeod, W. J. Morgan, and H. Arthur (Secretary). Mr. D. Pitts was invited to sit with the Committee.

AWARDS OF MERIT

The King, Perseus, Goldylocks, Makeda, Nesta II., Prince Albert, F. M. Ogilvie var. The Premier, and others, Odtas Leonatus and Brilliant, and the rare Adaglossa Pittsii.

Capt. W. Horridge, Bury (gardener, Mr. A. Coningsby), staged interesting home-raised seedling varieties of Waratah plants), Kestrel, and Minotaur var. Mc

Mr. D. McLeod, Chorlton-cum-I staged Cypripediums in variety.

Fluctuations in the numbers rodents

It is a well-known fact that in some the smaller rodents, notably mice and swarm over large areas of country a come a serious nuisance to farmers deners, and others.

It has been found that there is a goo of regularity in the occurrence of rodent years. Field voles in this count lemmings in Norway and Northern C swarm at intervals of a few years, and followed by a diminution in numbers, is apparently brought about by ep diseases.

We are carrying on an investigatio these cycles, and are desirous of obt information on the subject from v parts of the country, in order that ligh be thrown on their causes and prev measures devised.

The study of the epidemic diseases which the rodents suffer is also of ficance in connection with human and pathology.

We should be greatly indebted for a formation upon the following points:—

(1) Any pronounced increase or de among field voles, squirrels, or rodents, together with dates, loc etc.

(2) Any disease among rodents.

(3) Any increase or decrease in numb birds of prey, and of stoats weasels, in particular years.

A. D. MIDDLETON,
Department of Zoolo
and Comparative Anato
University Museum, Ox
(Rodent Investigatio

Thyrsacanthus rutilans

The crimson blossoms of this cha subject are greatly appreciated by f lovers at this somewhat dull period year.

Belonging to a branch of the Aca family, this plant requires stove heat moist condition at the roots.

Although often grown in pots, T. ru is seen to better advantage as a subject hanging-basket, where it has a better to display its long, trailing inflores with pleasing effect.

Several plants furnish better than a specimen. They each may be afforde port and placed at an angle to enab pendant flower-bearers to descend free the basket.

Syringing with tepid water will prove ficial, which, however, should be c tinued when the blossoms begin to ope

T. rutilans will prosper in a comp fibrous loam with a third of peat and sand.

Propagation is best effected by cuttin serted in the spring. J. F.

Shrewsbury.

CORN-GRINDING WINDMILL, picturesque Roundhouse variety, excellent preservation; nearly new granary; stabling, piggeries, etc.; in all 1 acre; main road, near Suffolk Market Town, ½-mile station; good oil engine and excellent stones for business purposes. Scope right man; freehold; possession £245.—THOS. A. MORLEY, 20, Queen Street, Ipswich.

Where
can I obtain ?

THE difficulty of not knowing exactly where you can secure some special line needed for the garden — probably recommended or seen elsewhere—is easily overcome by utilising the services of "G.I."

Considerable care over a number of years has been given to tabulating information on all aspects of gardening that shall prove of assistance to our readers.

Write us, therefore, when you want to know where to obtain any seeds, plants, shrubs, horticultural implements, sundries, or other accessories to the garden that you do not see advertised in our pages.

Address your enquiry, with stamped envelope for reply, to —

The Manager,
"Gardening Illustrated,"
Bouverie House, Fleet Street,
London, E.C. 4

The Perfect Path!

LILFORD GARDENS NR. PETERBOROUGH
(Photograph by courtesy of the Rt. Hon. Lord Lilford)

Some 12,000 sq. yds. of paths in addition to the Main Drive were treated with COLAS at Lilford in the spring of 1928, the work proving highly satisfactory.

COLAS is unequalled for providing the path with a clean, firm surface, which *eliminates the usual constant attention.* COLAS arrives *ready to apply*, and can be put down by anyone at any time of the year.

COLAS PRODUCTS LIMITED
Foreign Rights: Asphalt Cold Mix Limited
38-39, Parliament Street, Westminster, S.W.1
Associated Companies throughout the World.

One drum containing 30 gallons, costing 40/-, delivered direct to destination within the Railway Company's free delivery area, will cover approximately 100 sq. yds. of gravel drive or path. A considerable reduction is offered if 2 or more drums are ordered.

Write to Estates (K) Dept., for 24-p. Booklet & Prices.

Clean Trees mean Clean Fruit

The best time to attack a pest is in its egg or ova stage; it is then stationary and more "get at-able," and a higher concentration of wash can be used without harming the tree.

Abolene is the ideal dormant tree wash. It clears away moss and lichen and destroys Insects' Eggs. In recent trials trees sprayed with Abolene produced the heaviest crop of Apples.

Pint, 1/6; Qt., 2/6; ½-Gall., 4/6 Gall., 7/6.

Lilium auratum: How to Ensure a Fine Display

The Golden-rayed Lily of Japan is the queen of the Lily tribe. Its colouring is superb, and the fact that it bears from twelve to twenty flowers at once renders it second to none. As the season has now arrived when a large number of the bulbs are imported from Japan a few remarks as to culture will no doubt be welcome to many amateur and professional readers

N the first place it must be admitted that ilium auratum has given a certain mount of trouble, but this should not r would-be growers from trying it. If will only exercise patience they will it is as easily managed as any plant in ivation. It is as well to point out, how- , that home-grown bulbs are the . As a rule, imported bulbs d in clay are very good, but e-grown bulbs are better still, those who wish for the highest ess should by all means obtain e. If, however, imported bulbs obtained they should not be ved to flower the first season.

o ensure a fine display of pot ts of this Lily the bulbs should otted directly they come to hand. compost should consist of half n, one-quarter thoroughly de- d cow manure, one-quarter peat, a liberal addition of coarse r sand. The soil should be pped up and not sifted. For , ordinary bulbs 6-inch pots are e large enough. Place a layer eaves or Moss over the crocks. efully examine each bulb, and ove all damaged and decayed es. When potting, hold the bulb he left hand in such a manner o keep the scales close together, place it on a little compost in bottom of the pot. By all ns the compost must not get be- en the scales or decay is almost ain to set in. Keep the scales, efore, close together when put- in the compost, pressing the r moderately firm and leaving vel with the points of the scales, not covering them. The pots ld then be plunged in a bed of oanut-fibre refuse in a cold ne.

ot until growth commences t water be given, and as the ns rise from the bulbs fill up the gradually to the proper level the compost. Follow these ctions faithfully and there will be far er failures.

is not uncommon for the bulbs to come hand in a dry, shrivelled condition. In cases place the bulbs in a bed of oanut-fibre in a frame for a couple of ks before potting and they will nicely np up.

The Queen of Lilies: Lilium auratum platyphyllum

Where there are beds of Rhododendrons Lilies do well, as the necessary amount of protection is obtained and the flowers show up to great advantage against the dark green foliage of the shrubs

It may not be generally known that the finest display of this Lily in pots is obtained by planting the bulbs in a good bed of turfy loam or peat, and when the plants commence to open their flowers carefully lift and slip them into pots that will take the ball comfortably, returning them to the bed again as soon as the flowers fade. Carried out carefully there will be a magnificent display, far better than if grown entirely in pots. The roots suffer little or no check or injury, growth proceeds steadily, and the result is a fine display with a minimum of trouble.

It is not alone in the conservatory, however, that the queen of Lilies shows to perfection. Its finest growth is made in the open ground, leaving it undisturbed for some years, so that it may gain strength and develop fully.

At the spot selected for the Lily bed the soil must not be harsh or of a calcareous nature, as this is likely to prove injurious and will fail to produce healthy growth.

The bed must be well drained and the soil deep, mellow, and fertile, and there should be a small amount of shelter against the trying winds that frequently prevail at the end of spring.

Where there are beds of Rhododendrons the Lilies do well, as the necessary amount of protection is obtained, and the flowers will show up to great advantage against the dark green foliage of the shrubs.

The latter not only provide the necessary shelter to the Lilies when the stems and leaves are in a succulent state, but the soil will be found to suit them also.

After the flowering season is over of those grown entirely in pots water should be gradually withheld until the stems and leaves turn yellow. When this takes place cut down the stems and keep the soil quite dry, turning the pots on their sides in a frost-proof place until December or January. The bulbs should then be turned out of their pots and the old soil shaken away, and the bulbs repotted in fresh compost and treated as before.

Some of the forms of L. auratum are very beautiful; one of these, rubro pictum, has a stripe of yellow at the base shading into crimson at the top of the petal. Platyphyllum (see illustration) is a very strong-growing variety reaching the height of 6 feet and with flowers large in proportion. Another very fine variety is rubro vittatum, having a broad crimson stripe as well as being spotted with the same colour.

Sowing Antirrhinums

There is, really, no advantage to be gained by sowing these too early, any time during the next two or three weeks giving excellent results. Sow thinly, for the seedlings, if much crowded together, are very apt to damp off while yet too small for pricking off.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Early-flowering Gladioli

I AM glad to see a note in a recent issue drawing attention to this valuable, early-flowering section of Gladioli for pot culture, a purpose for which they are admirably adapted. When grown in variety they are extremely serviceable in the arranging of a display of flowering plants in the conservatory or show house. They are, moreover, of easy culture. They are equally valuable for planting outdoors in sheltered positions, either for effect or cutting purposes. When required in quantity for this purpose it is a good plan to grow them in a bed some 3 feet in width, having the protection of trees or shrubs to break cold winds from the north and east.
A. W.

Campanula Bellardii and C. cæspitosa

WITH reference to the recent correspondence on this subject, and especially that relating to the synonymy of C. Bellardii, C. pusilla, C. pumila, and C. cæspitosa, I may say that this is a question which has given me trouble for years. I have always been desirous of securing plants which I was certain were C. cæspitosa, and long ago I found in a good botanic garden three or four resembling dwarf forms of C. pusilla under the name of C. cæspitosa, but I could never obtain others of the same character. Farrer, however, in his "English Flower Garden," discusses the question under C. cæspitosa and says: "C. cæspitosa (Scop.) has nothing whatever to do with C. Bellardii, C. pusilla (Haenke), C. modesta, C. tyrolensis, C. pumila, or any other distinct species which have been shoved under its wing in gardens until all traces of the genuine species have been lost. C. cæspitosa is not a runner, but from one central tap throws up a dense cushion of many serried shoots, thick-set with little, narrow, toothed leaves, in no way distinct from those of C. Bellardii except by their number and density on the far more dense tuft, made up of far more and more close, packed, barren shoots, devoid of runners." He also describes the stems as a foot high, thin, and bare and wiry, with a loose shower of bells ribbed outside and drawn in at the mouth. Recently I wrote an obliging Continental botanist, who kindly told me that C. cæspitosa differed from C. Bellardii in two features:—"(1) The mouth of the corolla is not spreading as in Bellardii, but contracted somewhat. (2) It flowers late in August when the other is over."

Farrer, under C. Bellardii, gives as the reason for using that is that "the name of 1785 takes the precedence over Haenke's C. Hals pusilla of 1788." This should settle the question of whether we should employ C. Bellardii, or C. pusilla, or C. pumila.

Apropos of the subject, I wonder if anyone knows the whereabouts of the two varieties of C. Bellardii named by Farrer "Little Lady" and "Little White Lady," found by him in 1913, and a later one said to be the "Ariel" of Miranda, but powder-blue. It may seem ungrateful, but I am not sure that the older forms of C. Bellardii are not equal in charm to Miranda, Miss Willmott, and others. Size in flowers is not everything.
S. Arnott.

—— Campanula Bellardii, Ten., and C. pusilla (Haenke) being synonymous, and the first name taking precedence over the second, C. pusilla in its one hundred and forty-first year may be given a decent, but not too quiet burial. Referring to Col. Wolley Dod's query, C. cæspitosa is a distinct species and is described by Farrer as follows:—

"C. cæspitosa has nothing whatever to do with C. Bellardii, C. pusilla (Haenke), C. modesta, C. tyrolensis, C. pumila, or any other of the distinct species which have been shoved under its wing in gardens until all trace of the genuine species has been lost.

"C. cæspitosa is not a runner, but from one central tap throws up a dense cushion of many-serried roots, thick set, with little narrow toothed leaves in no way distinct from those of C. Bellardii, except by their
number and density on the far more

—— Without wishing further to add t
controversy about the synonymy betwee
Bellardii, C. pusilla, C. pumila, C.
lensis, C. cochlearifolia, and C. cæsp
of various authors, I simply wish to co
with my friend Mr. Fisher's request he
give such little information of the rig
bearer of the name of Campanula cæsp
as I may possess from actual acquain
with this plant in the far-away rang
Carniolia.

The late Mr. Farrer in his great
"The English Rock Garden" gives
an ample description of this plant, w
really makes any further attempt unn
sary, but perhaps some notes on how
travelling companion and I found this
may prove of interest to readers of Gar
ing Illustrated, especially as the plant
remains an almost unknown quantity in
English rock gardens.

The real reason for our venturing
Serbo-Jugo-Slavian territory, with al
difficulties of the language question,
that in that little-visited region, and es
ally on the great Triglav range, is the
home of that quaint and rare Campa
Zoysii, and whilst questing for this we
dentally found in the same sheer clif
hardest limestone wee tufts of very jag
roundish leaves just beginning to sprout
activity, for it was early in the season
late snow still sent down long tentacles
the north-facing gorges, and the cliffs t
selves were adrip with icy water from al

We had started our outing that
pleasantly enough in a small motor
from the Triglav Hotel at Bohj
Bistrjca, and left our conveyance some
further south, at the shores of that lov
of mountain lakes, Bohjnska Jezero,
pleasantly wandered along a good road
margin, watching whole shoals of trout
ing about in the clear water. Presently
passed a quaint church with a huge m
painting of St. Christopher carrying
Christ child through a raging stream,
then past a pathetic war cemetery
orderly row upon row of plain wo
crosses. Here we branched off to the
into glorious forest land. Various H
bores, the quaint Dondia epipactis, and
rare Astrantia gracilis, handsome Or
lamioides, and fine bushes of Me

ber and proud member of the English
ne Club, down the hill I should have
cursing my luck, but his able eye saw
othold here and a hand-hold there, and
ently a whole series of such which he
made a possible track, and so, he in
and I with my heart in my mouth fol-
ng, we overcame our difficulty, and pre-
ly were on our road again, but, alack
alas! gap followed gap, and forced us to
se that this road had witnessed a hurried
at, and that as the guns were dragged
ecurity the engineers had blown up the
in all the worst places to prevent the
ny from catching up with the retreating
y, and so we sweated along, making the
of our difficulties, and were rewarded
ome fine colonies of Primula Clusiana,
which we persuaded the most easily
ned clumps to take a seat in our ruck-
s, and mightily cheered by this find we
d ourselves before overlong upon the
nja Pass, where, we were informed,
should meet Campanula Zoysii close to
Italian frontier, in the steep cliffs of
est limestone flanking the steep screes.
uesting around for some time we pre-
y saw, here and there, the little spoon-
ed leaves of the Campanula poking out
airfine cracks where a knife-point found
ntrance and ice axe and chisel had to be
isitioned to chip out bits here and there
re the screes gave us sufficient foothold
e both hands at once.
ow we laboured, and how we slithered,
how we had to scramble and slide to
eve rucksacks which suddenly started
ther downhill on the moving scree, and

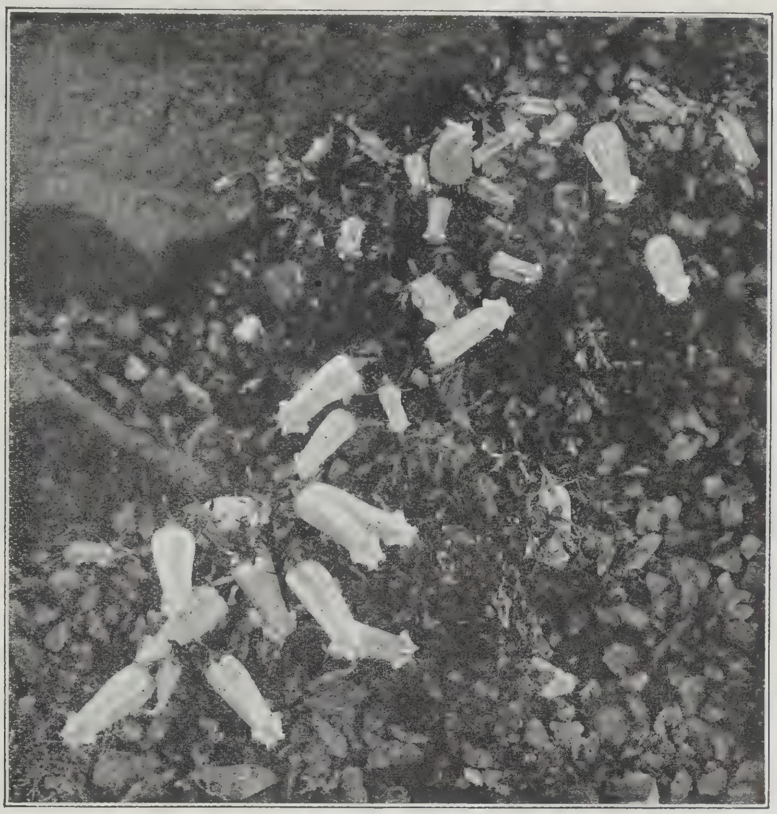
beyond our combined linguistic achieve-
s. A few days later a light dawned on
vhen, on a sunny cliff of Triglav itself,
same plant was met with again, and this



The quaint and rare Campanula Zoysii in the moraine

time there were just one or two early flowers to help us, and as undoubted Campanula cæspitosa of Scopoli the plant was determined.

At home in our nursery the collected bits soon settled down comfortably, and although by an error an old and misleading description of the wrong C. cæspitosa, the one equivalent to C. Bellardii, slipped through in the edition of our catalogue offering this plant, it yet led to our selling out the entire stock of our collecting, so that nothing remains to me but to retrace my footsteps to the mountains east of the Tyrol and try and bring back a further haul for the benefit of my fellow plant lovers.

I will add nothing to the description of the flowers of this Campanula, which appears above Mr. Fisher's signature, but to say that the individual bells of C. cæspitosa Scop. closely resemble the urn shape assumed by the bells of the big Irish Heath, Menziesia polifolia, and that the colour is a smoked purple with deeper veins, and that the graceful stems may reach about 9 inches. To my mind it should always be grown as a plant for the narrow crevice lest it grows fat and stodgy as will the graceful Harebell of our poor and gravelly common lands.

W. E. Th. Ingwersen.

"When idols have feet of ——"

"Clay" might, with some advantage, have extended his examples of the point he raises (page 23) to the vegetable world, to fruit, to trees and shrubs. Almost all catalogues, as "Clay" says, set before us nothing less than a kind of horticultural "Utopia" wherein everything may be expected to be as vigorous, floriferous, and productive as the most noxious weed. He is right, Primula Florindæ is, indeed, coarse unless grown somewhat *out* of its element; Meconopsis Baileyi is a "wash-out" in five plants or five gardens out of six. May I add that at least half the culinary Peas put into commerce through "snap" in cultivation or quality are not worth the ground they occupy? And so on.

To set before us, as the catalogues do, an Utopian standard of perfection is, no doubt, in some ways both logical and legitimate. Perfection must always be our ideal, horticulturally as otherwise, but in the striving after it we shall probably be in no degree discouraged or suffer deprivations of interest and zeal if the pictures of perfection continually set before us be vested in the essential element of truth. And I do not think that the revelation of "vices" in plants as well as their "virtues" would deprive distributors and vendors of much, if any, of their material profit.

Probably the word "hardy" represents the greatest "snag" and, withal, the most attractive bait for the unwary. Plants are frequently described and catalogued as "hardy" when, as a matter of fact, they are so only in one select corner of the country or under certain conditions only of soil or climate. Thus again is the half-truth worse by far than the whole, and the Utopian ideal of a garden anywhere, furnished with everything desirable, nothing but a myth.

J. R. K.

Proposed Society of Garden Architects

I wholly agree with a "Scottish Landscape Gardener's" remarks on page 21. But I notice he refers to the "outstanding men in the profession" giving the lead to the institution of the suggested Society. Upon what basis, may I ask, or upon what evidences of qualifications, are such men to be judged as "outstanding" in so far as they might be fitted to give the lead? Reputation alone, one would imagine, is altogether inadequate; successful and impressive examples of work as seen at the great shows would seem to be equally so. The success of any such Society as that proposed will be governed largely by the true qualifications of those who "give the lead" in its formation. For experience reveals the indisputable fact that the efforts of many, but not all, of so-called outstanding garden "architects" (a designation rightly discounted by your correspondent!) are nothing less than lamentable.

Nevertheless, I am bound to say, in fairness, that I have seen, known, and worked in gardens which in no way could be unworthy of the description magnificent. Some I have seen at the shows, a few, but not many, relatively speaking, I have seen elsewhere! Undoubtedly, therefore, I am at one with a "Scottish Landscape Gardener" in urging the extreme importance of due and approved qualifications on the part of those who are to give the lead or be admitted to membership of the proposed Society.

J. R. K.

—— I was very glad to see the letter in your issue of January 19th by "Allen Water." It seems to me that anyone might subscribe to such a Society, and, when enrolled as a member, might work havoc with a garden. The name garden architect would be quite sufficient to keep one from interfering with those owned by many who really love them. One can understand the term architecture when applied to a building, but it is altogether a misnomer when applied to a garden, to say the least of it. "Abomination" is, I think, not too strong a term for it.

A garden plan drawn out for the making of a new one is still fresh in my memory. It had all the modern gadgets, introduced, of course, so as to be in the "fashion." There was a pergola to be placed where it justified the best views from the sitting-room windows, there was a Rose garden to be placed underneath them which would look untidy all the winter, and a low stone wall for the growth of rock plants was to be placed within a few feet of another sitting-room window.

I pointed out to my friend that the position chosen for his rock plants was too shady, and any which might happen to flower would do so on the side of the wall farthest from the windows.

The plan was, fortunately, scrapped. A rock garden was placed where the pergola was to have stood, and the view preserved, a lawn laid down under the windows with a border of Roses at the side of it, and a pergola of Roses on the other side of it to hide some not too beautiful outbuildings. As your correspondent writes, "owners of gardens requiring advice should be wise enough to call in the services of a good, practical foreman who has worked for one of the larger nursery firms, or one who has made landscape gardening his profession." Even then there is a danger of getting too much repetition of other people's work and not enough originality if not many stereotyped designs. It is an utter mistake to overload a garden with stonework and ornament, and the use of the word "architect" suggests it. The term Society of Garden Designers might, perhaps, meet the case (if one must have a Society), since one can hardly call laying out a small suburban plot landscape gardening, perhaps, but either term would be preferable to garden architect. Though this would be useful as a warning, I should never employ a member of a Society with such a name. If we must have guidance let us obtain it by visiting fine old gardens, yet remember that every plant and every plot of ground must have individual consideration and treatment.

Brighton. F. R. H. S.

—— I think "Scottish Landscape Gardener" is right in some of his comments on the above (issue January 12th). To begin with, I agree with him about the designation, which, I think, should be landscape gardener, a real old English term; also he is right for excluding every adventurer without qualifications from joining the Society. True, there are "jobbing gardeners," who do not know a thing about landscape work, masquerading as skilled men, but *not all*. I myself (at present) am a jobbing gardener, and yet most of my work has been landscape gardening, such as making new gardens, lawns, rock gardens, ornamental ponds, and drives. I have a natural aptitude for landscape gardening, and my work has always been very satisfactory to the people concerned, and there are others I know similarly situated. Why should not *we* have a chance of joining the Society? I admit that those people who have had a life-long experience should be in a higher class. I suggest that every prospective member, good or bad, should be given a chance by means of an examination, and that, I think, would end all dissatisfaction whatever the rank. The rising generation should be given a chance, through the Society, to make some headway in the profession. Jobbing Gardener.

Primula anisodora

On page 44, in an article on new seeds, Primula anisodora is mentioned as having flowers as large as a sixpenny-piece. I should be glad to know where this can be obtained, for the plants that I have always seen never had flowers anything approaching this size. In fact, this species seemed to be the smallest-flowered in the section Candelabra.

It is a great pleasure to see Mr. E. A. Bowles' writings and drawings again.

I hope it is the beginning of many more such contributions, for we see far too few of his nowadays. Reader.

Hampshire.

Covering bulbs

Will some of your experienced readers inform me why it is necessary to cover bulbs grown in pots or boxes with ashes, etc.? When planting similar bulbs in the open ground nothing further is placed on top of the soil. What is the reason, and what benefit is there in giving them such a covering, and is it necessary? Inquirer.

The leaves of Ranunculus Lyalli

With reference to the note and illustration of this beautiful New Zealand plant (issue January 19th, page 36), I note that seed is being offered this year by an English firm. A curious error, however, is made in the catalogue description by this well-known firm, which states: "The large, fleshy rhizomes throw up big, glossy, *sword-like* leaves." Surely the leaves are more like soup-plates than swords! Indeed, have we not heard of wanderers on the McKinnon Pass picking the leaves of this noble plant and using them as saucers? C. T. K.

Dahlia Maxoni

I should be glad to know of anyone's actual experience of Dahlia Maxoni. I bought seeds last year. They germinated well and the plants grew splendidly, but there was no sign of a flower.

A. M. A. H. Rogers.

St. Hugh's College, Oxford.

Some of the lesser-grown annuals

I fear the article (page 40) is by no means comprehensive and that there are omissions which need remedy ere the list of annuals could be called representative. I need mention only three, none of which is included, all shades of blue, the colour which is least often found and most frequently desired, and none of which seems to be grown as frequently as they should. They are Gilia achilleæfolia, 18 inches to 2 feet, cobalt-blue; Asperula azurea setosa, 1 foot, pale lavender-blue, so free in bloom as to appear
cloud; and Eutoca viscida (syn. Pl
viscida), deep blue with speckled and
centre, 1 foot. All are perfectly hard
satisfactory in ordinary light soil.
Asperula seems suited by either sun or

Bearded Irises: "Eastern pallida" and their descendants

The Editor's invitation to critici
Wynn Helling's article headed "
Irises" (January 5th, 1929) prompts
make a confession, for which, as my
mentioned in the article, this seems t
opportunity. Incidentally, a little lig
be thrown on the subject.

To begin with the wild originals
plants under discussion, viz., the g
what may be called "Eastern *pallida*
it seems odd that Mr. Helling does r
to the high authority of the late Mr.
in whose great monograph, "The
Iris" *Ricardi* is said to be a variety
potamica. In his later work, "A H
of Garden Irises," the statement is
less positively. In both books cyp
carefully distinguished from mesop
I have heard Dykes express a doubt

her of these species was to be seen any
ger in any English garden. *Cypriana* was
roduced by Sir Michael Foster in 1888;
first appearance in this country of *meso-*
amica (from Armenia) does not seem to
on record; *Ricardi* (from Palestine) has
en successfully grown in the South of
ance, and much used, as by M. Denis, of
laruc, near Montpellier, for hybridisation.
ave never seen it in England. All three,
ording to Dykes, need more sun than they
erally get in our country; he recom-
nded for them a " heavy, calcareous soil."
the United States something called *meso-*
amica is grown. I have had two forms
t me from California, but, as they hardly
d rent with me, I gave them away to a
rmer garden.

o much for the wild forms, the hardiness
whose hybird progeny is challenged by Mr.
lling. And now for my confession, if a
her egotistic story will not be out of place.
Michael Foster gave me a bit of his
ginal plant of *cypriana,* sent to him from
prus. It never throve satisfactorily, and
long since gone west. I never raised any
dlings from it, nor used its pollen. But
ought from nurserymen plants listed as
riana, in order to see what they were
e, and from one of these, a fine stout
ng, but certainly not *cypriana,* I raised
rids, one of which is in commerce as
lingbroke, whose parentage I recorded in-
urately as " *cypriana* x Miss Willmott ";
seed parent's name should have had a (?).
art from this cross I cannot recall any
ers raised direct from either true or false
riana; but I have raised many seedlings
m Caterina (one of Foster's crosses of
riana with *pallida*), such as Ann Page,
via, Volumnia; and Leonato is a seedling
ain of Volumnia. Hence the expression
Sir Arthur Hort's *cypriana* hybrids " is
sleading, since, properly speaking, no such
rids exist. My Caterina crosses (which
doubtless the plants indicated) are second
third, not first crosses, and have in them,
well as *cypriana* blood, that of more
ust parents and ancestors. Two of these
ve indeed received the R.H.S.'s Award
Merit, which is only given to plants of
ved constitution. I do not of course deny
t the presence in them of *cypriana* blood
ggests that the more ripening they get,
better; but I submit that until 1928 they
not had in this country a proper ripen-
for several years.

have made confession No. 1, for which
excuse is that, when I began to raise
ses from seed and recorded their origin
h insufficient accuracy, my stud-book was
y meant for my own use, as I had no
ught of putting the plants in commerce.

Confession No. 2 is of like nature. After
ster's death his widow gave me some
ses, and, among others, a scrap labelled
the Shelford garden " *Ricardi* x." This
eloped into a huge plant with very tall
ms and handsome flowers of a reddish-
rple, which, however, were not first-rate
either form or colour. I used it freely as
seed-parent, and (loosely again, I fear) re-
rded the crosses as " *mesopotamica* x Lady
ster," etc., seeing that *Ricardi* is but a
riety of *mesopotamica.* From this parent
me Antonio, Eglamour, Shylock, Desde-
na, and others. All of those mentioned
em robust enough (Antonio, indeed, is a
rific grower), though it is true they can-
t be relied on to flower, whatever the sea-
, as freely as (say) Souvenir de Mme.
udichau. I cannot of course say what
s the pollen-parent of the original plant,
ster's " *Ricardi* Seedling," and probably
ster did not know, or he would have given
on the label. I am much to blame for not
ving indicated this plant with proper pre-
ion; the excuse is given above.

The moral of all this is that, so far as my experience goes:—

(1) The three " Eastern pallidas " are, in England, at least, not everybody's plants:

(2) The same must be said of some (not all) of the first crosses raised from them. Such plants require several years' testing:

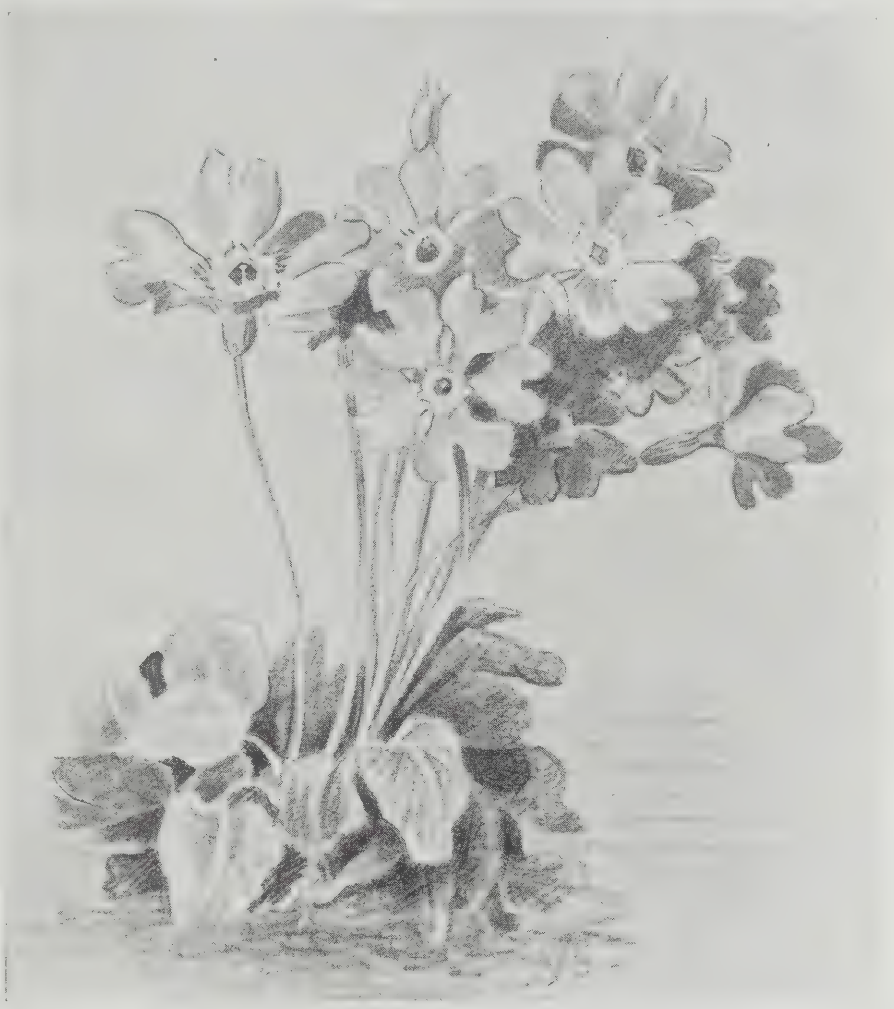
(3) But that if seedlings again are raised from these latter, many of them should prove to have a much more satisfactory constitution.

ARTHUR F. HORT.

Primula fasciculata

THE only fault I can find in this little gem of a Primrose is that it is still a very scarce plant in gardens. I had better say at once that I have no notion where plants can be obtained, and so check at its source a stream of letters of inquiry.

The drawing was made from a plant grown in a pot at Wisley—sent to me for that purpose—some years back. It still lives in the same pot, as I have never found the pluck to trust it in the open ground in this anti-Primula garden. If I knew of a large stone in my rock garden that retained one mossy face throughout July and August I would plant my ewee lamb (as the nice child called it) close against that mossy backing. In this land of hot, dry summers it is ever a puzzle where the chaffinches find enough Moss for their nests. I could not, and unless living on the charity of the last consignment of well-packed plants am obliged to send off my consignments wrapped in grass or wet newspaper. The drought that burns out our Moss kills our choice Primulas.



From a drawing by E. A. Bowles

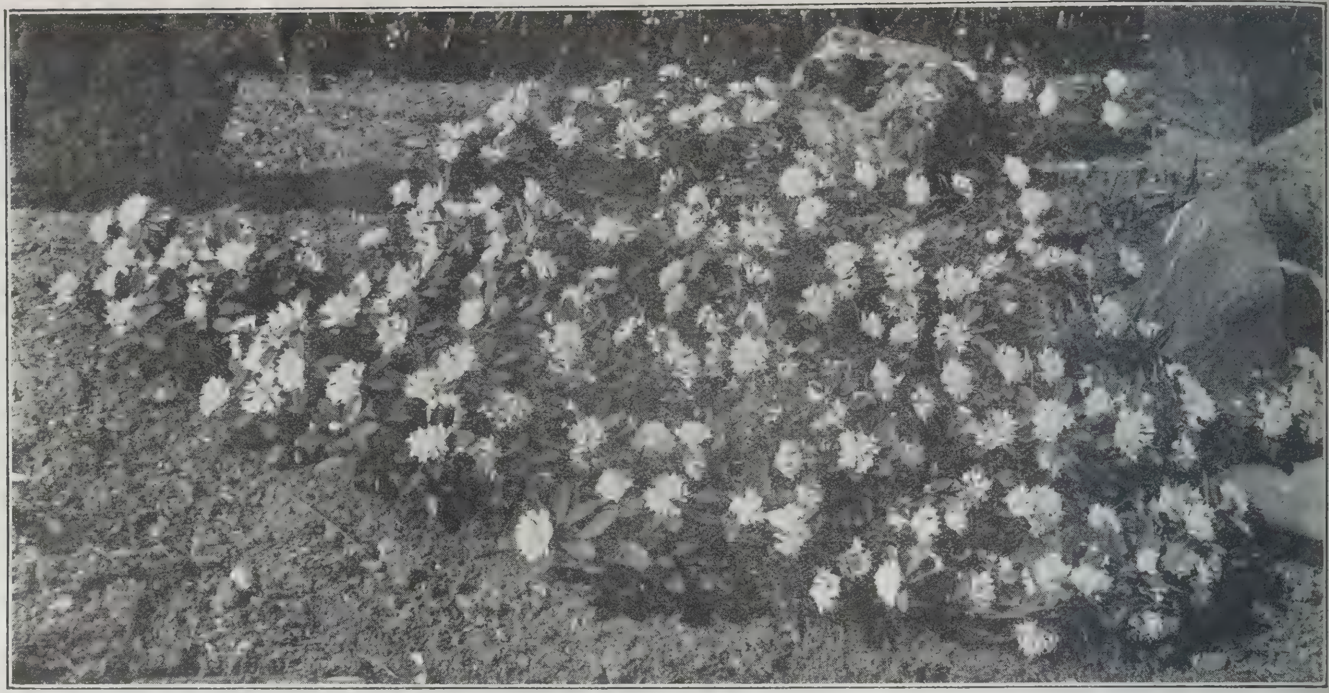
Primula fasciculata (slightly enlarged)

P. fasciculata was found in Yunnan by Captain Kingdon Ward in May, 1913, covering bogs on the Chungtien plateau, and was first described in Sir Isaac Balfour's list of 50 new Primulas in the Notes of the Royal Botanic Gardens, Edinburgh, for April, 1915.

What we might call its official identification disc would bear the inscription: " Like the East Himalayan P. tibetica, Watt, but differing in larger flowers, always solitary in the axils of the leaves." From a garden standpoint we may say it is what P. rosea would become if Titania turned it into a fairy. It possesses P. rosea's brilliant colour, a little refined and softened by a strikingly beautiful eye. The drawing shows the delightful shape of that clear yellow eye and the dainty edging of a deeper red that outlines its margin. Then look at the small size and neat arrangement of its leaves compared with the mass of flowers, each on its own slender stalk. A Primrose form with its individual stalk somehow pleases me more than the Polyanthus form with its stout communal scape, but I may be in a minority.

I am sorry to find that in the vagaries of reproduction my drawing, made on an enlarged scale to allow of the usual reduction, has grown a trifle larger. So those who are fortunate in adding this delightful species to their collections must expect something even more fairy-like in size than this enlarged portrait of a very fine and well-grown specimen.

E. A. BOWLES.



Daphne Blagayana
One of the daintiest and choicest of low-growing alpine shrubs

Early-flowering Daphnes

THERE is a subtle charm about the early flowering Daphnes which few are proof against, and their cultivation in most gardens is a matter of considerable interest. D. Laureola, our native Spurge Laurel, is a familiar species growing with great luxuriance in shrubberies and woods, and reproducing itself freely from seeds. It often produces its green flowers as early as January, and, having the merit of evergreen foliage, it adds to the effective decoration of the woodland. The old D. pontica closely resembles it in some respect and forms a cheerful object during the winter months. The flowers are a pale yellowish-green. It manages to store quite a perceptible amount of fragrance in its miniature but shapely blossoms.

Beautiful as these species are, there are, fortunately, many others of more refined beauty that are suitable for growing in our gardens. One of the most familiar is D. Mezereum, which may be found in many cottage gardens. It is a charming little shrub with clear purple-coloured flowers which crowd the twigs in cylindrical masses. Its fragrance is so powerful as almost to induce a sneeze, and it is difficult to get rid of the scent when it has once been inhaled. There is a white form equally as attractive, also another variety known as D. M. autumnalis. This species usually flower about November, and continue to do so until the typical Mezereum begins. D. Neapolitana (Fioneana) is an evergreen shrub of some 2 feet, with deep green evergreen foliage and terminal clusters of rosy-lilac flowers. It usually flowers in March, but I have known it flower profusely in February, when it makes a bright splash of colour. D. odora is a tiny evergreen shrublet with rosy-pink flowers. It can boast to be the most powerfully scented of all Daphnes, but, unfortunately, is not thoroughly hardy, and it is only in favoured districts or against walls that it may be trusted to survive our winters. It has an excellent substitute in D. Dauphini, which it closely resembles. This species begins to bloom in January and continues to flower till early spring.

D. Blagayana is a sturdy and dwarf little low-growing shrub, an Alpine from the heights of eastern Europe. It grows in a spreading, somewhat prostrate, loose manner, forming plants about 6 inches high, with dark evergreen leaves and large, white, sweet-scented flowers borne in clusters at the extremity of the shoot. The plant is good in habit as well as handsome in bloom. Even in the depth of winter it is attractive, owing to the deep colour of the foliage, which is as green as our native Box, and the clusters of flowers, deliciously fragrant, are produced freely enough to make a good display.

The plant enjoys in cultivation a wide, deep declivity between two rocks in which provision is made for a good depth of soil so that it may spread and root strongly between blocks of stone in a good, rough mixture of loam and peat. It may also be successfully grown on level spots and the plants placed between small blocks of stone near which the roots ramify and are kept cool and moist. Constant pegging down, top-dressing with sandy peat, and plenty of water during the hot season are the passports to success with this plant.

Many would have more success with the much later D. Cneorum if it were treated in the same way. It is a slow grower and suitable for the smallest garden.

H. STEVENS.

Gloxinias from seed

The modern varieties of Gloxinias, with their distinctiveness in habit, their exquisitely coloured and erect flowers, and their free and continuous flowering qualities, are amongst our most valuable indoor-flowering plants. The flowers of these modern varieties are of great substance and are remarkable for their richness and variation of colour. The range of colours include pure white, pink, scarlet, crimson, violet, and purple, while some varieties are delicately spotted with an infinite variation of colours which make them highly interesting and attractive objects, and striking contrasts to the self-coloured forms.

Few plants are so easy of cultivation, provided space can be found for them in a house which affords moist atmospheric condi
and a genial temperature, for plants ca

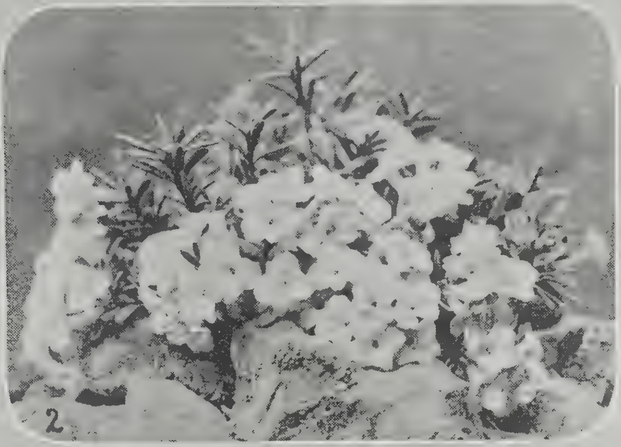
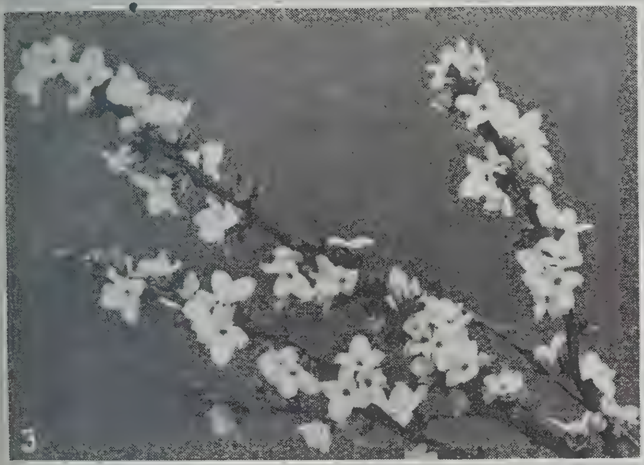
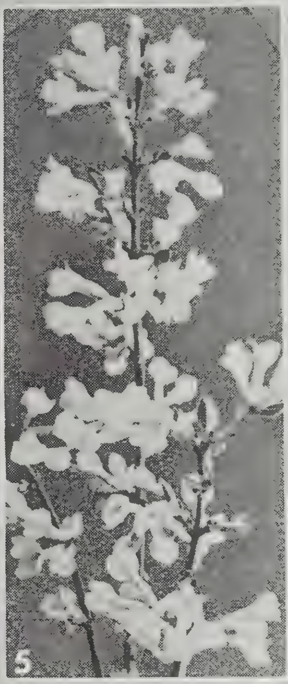
W. AUTC







EARLY-FLOWERING DAPHNES

. The Garland Flower (D. Cneorum), with clusters of rose-red flowers sweetly scented, the prettiest dwarf shrub in the Alpine garden.

. D. rupestris, syn. D. petræa. A treasure of the Eastern Alps.

. White Mezereum (D. Mezereum album), seen in many cottage gardens.

4. The most powerfully scented of all—D. odora, syn. D. indica, a greenhouse species from China.

5. D. Genkwa. introduced from China. Lilac-like flowers.

6 and 7. D. Mezereum flowering in March, believed to be truly wild in some of the southern counties of England.

Chrysanthemum New Year. Award of Merit

Royal Horticultural Society

THERE were Cypripediums, Carnations, late-flowering Chrysanthemums, early-flowering hardy plants, Poinsettias, collections of Apples, and a fine display of vegetables at the Royal Horticultural Society's fortnightly meeting held at Vincent Square on January 15th. The previous fixture was abandoned on account of the death of Lord Lambourne, the President of the Society, so that this was the first meeting of the year.

CYPRIPEDIUMS AND OTHER ORCHIDS

Three Gold Medals were awarded to Orchids on this occasion. The Cypripediums were remarkably good, but there was an absence of really good Cattleyas, due no doubt to the recent prevalence of fog throughout the country. Odontoglossums and Cypripediums withstand fog far better than Cattleyas. One of the best Cattleyas seen on this occasion was Bridal Veil, a really lovely white with a touch of gold in the labellum. This variety is illustrated and described on the page opposite.

The collection of Cypripediums sent by Miss A. B. Moore Chardwar, Bourton-on-the-Water, for which the Gold Medal was awarded, was the envy of all who grow Cypripediums. About 70 hybrids raised by the late G. F. Moore were shown. The Chardwar varieties are noted for their good forms, wonderful size, giant proportions, the breadth of the dorsal sepals, and for the fact that they are extremely well grown.

From Armstrong and Brown came the massive Cypripedium W. H. Page var. Grace (see illustration, page 61). The dark chocolate spots stand out in marked contrast on a green background, the pouch is bronze, and the dorsal has a broad, well-defined, white margin.

Gold Medals were awarded to Charlesworth and Co. and J. and A. McBean for superb groups of Cymbidium, Cypripedium, Calanthe, and Odontoglossum hybrids.

Among the Cypripediums shown by Cypher and Sons was the very pretty variety Cupid, pale amber with dark spots and tipped white on the dorsal sepal.

CHRYSANTHEMUM NEW YEAR

An Award of Merit was granted to Chrysanthemum New Year, a late-flowering single of medium size and of value for market and cutting. Shown by H. Shoesmith, Junr., Mayford, Woking. The colour is golden-orange with a yellow zone and the flowers are borne on long, stiff stems.

CHOICE VEGETABLES IN JANUARY

The Gold Medal collection of vegetables by Sutton and Sons was one of the finest efforts, from a cultural point of view, that has ever been displayed at Vincent Square in January. In addition to first-class pr
of the general run of forced vegetables,
as Carrots, Mushrooms, Lettuce, F
Beans, Dandelion, Marrows, Chicory,
Cucumbers, were the lesser known l
such as Tree Tomato Cyphomandra be
Cardoons, Chilies, Oxalis crenata (tu
and Stachys tuberifera. H.

A plant of Cypripedium Cupid, shown by Cypher and Sons n they make a fine show. The Stag's rn Fern (Platycerium alcicorne) is a aint-habited plant and is very distinct from other members of the Fern tribe. In its ive wilds it grows on the branches of es. In cultivation it is attached to pieces wood to which it clings. It requires very ile atmospheric moisture. Formerly it s treated as a stove plant; nowadays it is wn in ordinary greenhouse temperature, y needing to be screened from very hot n. I once grew a plant several years in window of a living-room, and I was sur- sed to see that it remained quite happy d increased in stature. It was wired on to iece of wood which was stood in a 4½-inch t and which was filled to the rim with cks. The only attention given was to nd the pot in a pan of water so that the cks became thoroughly moistened. No nging or cleaning of any kind was done. Those who use window-boxes should have o sets, one filled in the autumn with spring- wering things, such as Silene, Forget-me- ts, Daffodils, and Hyacinths, to be placed position in March, these being replaced rly in June by summer-blooming things. this way there will be a nice display for out six months in the year. Those who ed plants for window-ledges cannot do tter than use encrusted Saxifrages, Sedums, d Sempervivums, as they are not affected extremes of heat and cold. A neighbour ted a box on to a ledge which he converted to a miniature rock garden, filling it with mixture of loam, leaf-mould, and brick- bble, with stones inserted at intervals. It s a great success and was much admired.

J. CORNHILL.

Asplenium bulbiferum

Those who want a foliage plant for the nall sitting-room as a change from the eful but somewhat hackneyed Aspidistra ight try this handsome New Zealand Fern. produces its graceful fronds freely under ch conditions, and they stand remarkably ell, a slight sprinkle overhead occasionally eeping them fresh and green. I picked up plant in the early spring that had ap- rently been thrown away as hopeless, with ur tiny fronds, one of which was broken, t as there were plenty of healthy roots I t it in a 32 pot, using a compost from a ap of good road sidings (free from tar), ith which was mixed a liberal amount of y horse-droppings well rubbed to shreds. here is no mistake about the response; it is w a shapely window plant with 15 hand- me fronds, some of them 16 inches in ngth.

E. BURRELL.

Hardwick.

ontradenia floribunda (syn. Plagiophyllum)

This pretty member of the family Melas- maceæ comes to us from Central America. he genus comprises six or seven species, hich are stove evergreens. Lovely lilac- se flowers are borne in panicles of seven eight to each. Leaves that are reddish on e under surface, together with stems of the me hue, combine to give to the plant a inty appearance, which "goes" well with e colour of the flowers.

Cuttings made from side shoots should be serted in coarse sand and loam during ebruary, keeping them "close" in a propa- ating case till rooted.

When this has been accomplished pot off to sixties and pot on when required.

The compost that this little plant thrives st in is one of sandy loam and decayed af-soil in the proportion of one of the former d two of the latter.

F. H. WRIGHT.

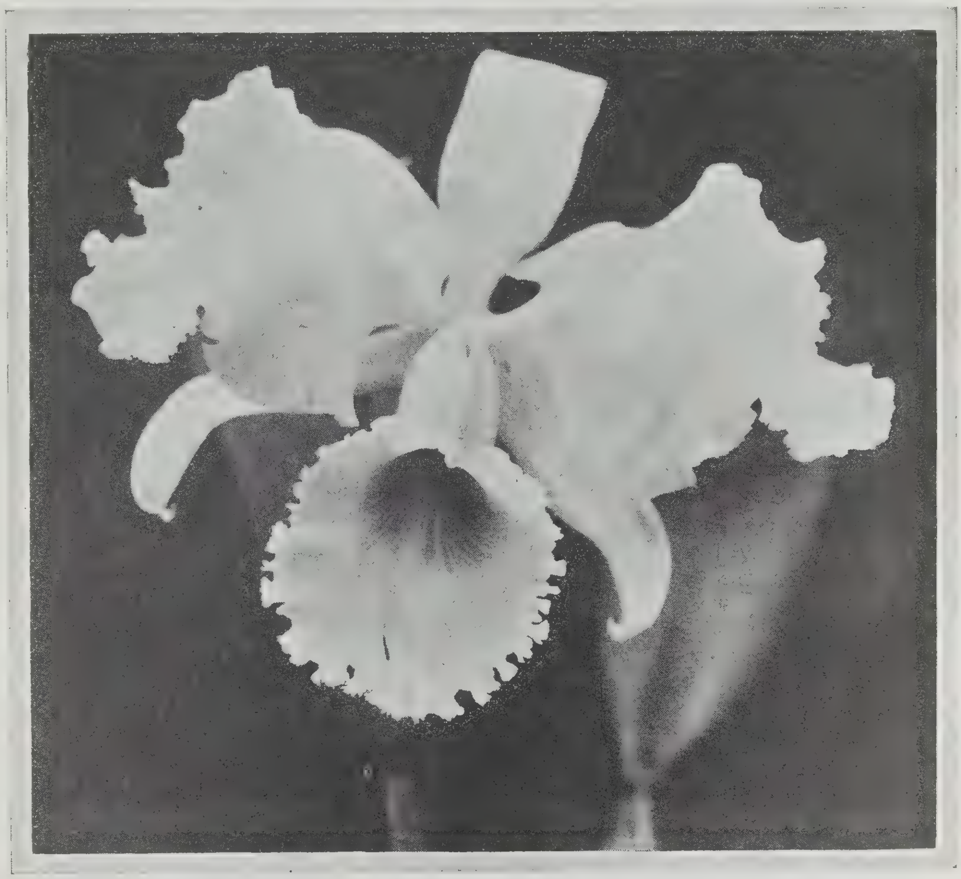
University Botanic Gardens,
Cambridge.

Cattleya Bridal Veil

THE illustration represents a very fine white Cattleya exhibited by Messrs. Sanders under the name of "Bridal Veil" at the R.H.S. meeting of January 15th.

Among white Cattleyas it is remarkable not only for the pure whiteness, but also for the shapely contour of the flower. The petals, some 4 inches in length, are nearly 3 inches in breadth, the sepals are in proportion, and the lip, the throat of which is somewhat tubular, with the margins meeting, develops the front lobe into an almost circular expanse, with a frilled edge. The only colour is the usual yellow, apparent in the throat beneath the column.

The hybrid was first exhibited by Messrs. Sanders in 1926, and was obtained from Cattleyas Lady Veitch and Mendelii alba. The Mendelii form is a species, but Lady Veitch was raised by the same firm, with Lueddemanniana alba and Warneri alba as parents. No doubt to the Lueddemanniana influence is due the breadth in the petals and the shape of the lip.



Cattleya Bridal Veil

White Cattleyas are more prevalent to-day. Twenty years ago they were only occasionally received among imported Orchids, and their rarity gave them a high value.

Most of the species yielded white forms, but never in quantities. White varieties from time to time were flowered from Mossiæ, the albino of which is known as Wagnerii, Lueddemanniana (better known, perhaps, as speciosissima), labiata, Warneri, Trianæ, Schroderæ, Mendelii, Percivaliana, Eldorado, and Gaskelliana.

The happy idea of crossing them arose, and Orchid collections are now enriched by a goodly number of pure white-flowered Cattleyas.

In that section of Cattleyas with two leaves surmounting the pseudo-bulbs albinos are, for some reason, not so common, excepting in the species Skinneri and intermedia. Skinneri alba has been grown for many years, and the white form of intermedia is also comparatively common, though now eclipsed by hybrids derived from it.

In this species the yellow present in the throat of most whites is absent, and in many of its progeny the yellow is reduced to a faint tinge or entirely missing.

The white form of Cattleya Harrisoniæ has also been imported and is in cultivation, but in such species as granulosa, bicolor, Forbesii, Bowringiana, velutina, etc., white forms, if they exist, have never got into general cultivation.

E. COOPER.

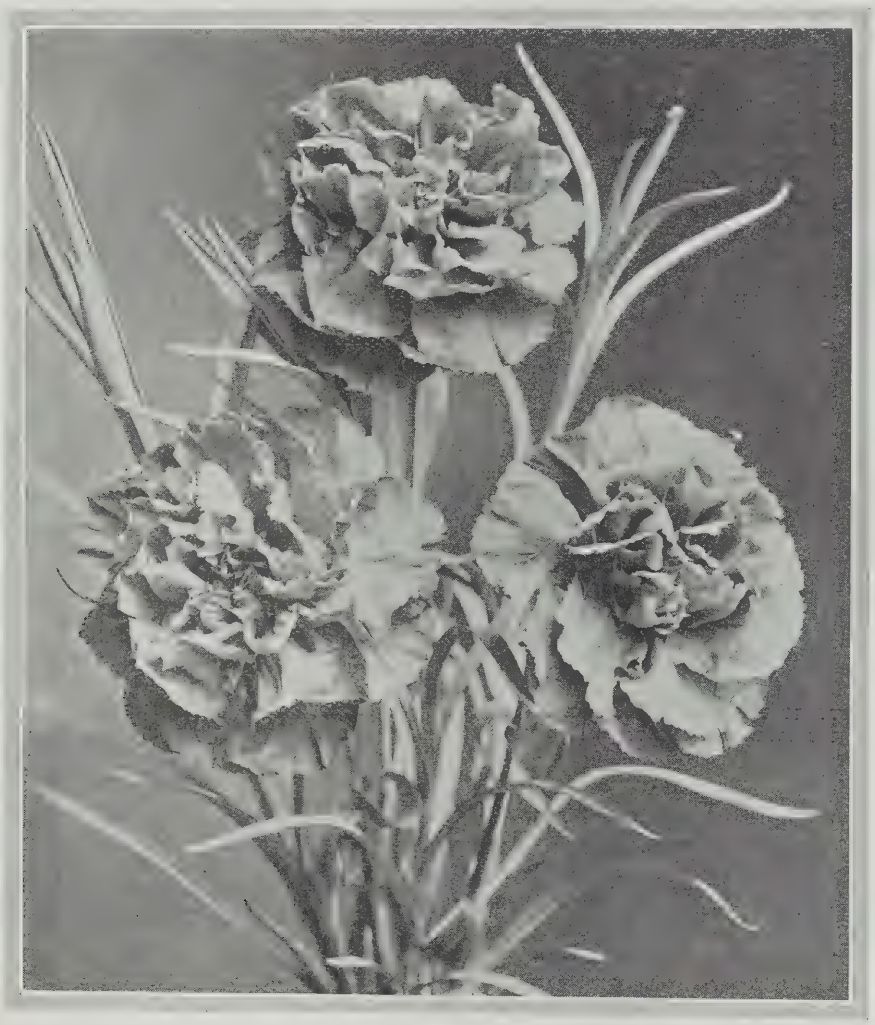
Climbing plants in the conservatory

If the climbing plants in the conservatory have not already been thinned out or pruned, according to their several requirements, the work ought not to be longer delayed. It is wrong, however, to treat them all alike. For example, to prune Habrothamnus (Cestrum) elegans now would be utterly wrong, the pruning ought to be done after flowering-time. Another instance may be cited in Bougainvillea spectabilis, which, differing from B. glabra, flowers on the terminals of the previous year's shoots. Here, too, pruning would be wrong. Lapagerias ought merely to be thinned, excising the weaker shoots cleanly. See that these plants do not get dry at the roots. Plumbago capensis may be pruned severely and freely thinned. If too much wood be left it is a brake on strong growths, and these flower most freely. Tacsonias and the commoner Passifloras should be dealt with moderately, spurring, rather than cutting hard back, giving the best results. Solanum jasminoides and Cobæa scandens must be drastically dealt with, otherwise they become masters of the situation. Prune Roses in corridors late in February.

A SCOTTISH GARDENER.

Carnation Thomas Ives

THE colour of this new Carnation is bright cerise with clear, flat-shaped petals one-third larger than a halfcrown-piece. The individual flowers are sometimes 4 inches in diameter. The plant makes a particularly strong growth with very glaucous foliage. The Award of Merit was granted on a date which shows the variety to be a good bloomer in mid-winter. Exhibited by the raisers, Messrs. Stuart Low and Co., Bush Hill Park, Enfield.



The new Carnation Thomas Ives, raised and shown by Stuart Low and Co.

A handsome weed

I call Helleborus fœtidus a weed, not because I think it weedy, for I do not, but because it is a native plant that grows freely in some places, though not everywhere, like other weeds. I remember some years ago finding a colony of this Hellebore in Selborne, in a somewhat ragged Beech wood above the Hanger. In his 41st letter Gilbert White heads a list of plants native to Selborne with—to quote from the letter—"Helleborus fœtidus, Stinking Hellebore, Bear's-foot, or Setterworth, all over the High Wood and Coney-Croft Hanger. This continues a great branching plant the winter through, blossoming about January, and very ornamental in shady walks and shrubberies." As regards the unhappy attribute "fœtidus," this Hellebore is not so very fetid; indeed, it is not fetid at all, as I understand the word. I can, myself, stand most of the vegetable scents fairly well (barring Stachys sylvatica), and though I would not exactly court the peculiar acrid odour of this Hellebore (which, by the way, it does not give out till it is crushed), I do not find it more unpleasant than the smell of, say, crushed Chrysanthemum leaves or the crushed leaves of the Scottish Bluebell. I know the name Setterworth only as a book name, having never heard it used. No doubt the Hellebore was the "wort" used in connection with a kind of animal surgery called "settering," and no longer practised.

Anyhow, call it what we may and smell as it will, the fetid Hellebore is a singularly handsome plant in summer or in winter, though it is at its best in the depth of winter—in January as the observant naturalist notes. Its large panicle of flowers, which go on expanding throughout January and February, and well into March, is a striking ornament in the garden, for, though the flower is green, it is a peculiar green, a light Apple-green, in contrast with the handsome foliage which looks as if carved out of dark jade. Here at the present time—that is, in the first days of January—the as yet unexpanded flowers are gathered on the dome of foliage in a loose bunch like a cluster of green Filberts. When the flowers open, each blossom is found to be rimmed with an edge of dark red, though this has to be looked for and does not contribute much to the general effect. But, after all, the glory of the plant is its handsome many-fingered foliage, of a dark green and as substantial as leather. The leaves are in the truest sense evergreen, as green in the height of summer as in the depth of winter. Everyone knows how easy it is to get flowers in the flower season, but how difficult sometimes to find suitable foliage. The Hellebore will often supply
felt want, for its leaves look right
almost anything. But it has two faul

with fluid there is no need to do it ag
If the work is badly done it is waste
money, and to spray the trees the sec
time may result in injury to some of
buds. Choose, if possible, a dry, still
for spraying, and if our readers have
previously done much winter spraying t
will be surprised how very few dry, still d
occur between now and the end of the mo

The work of Apple pruning is now in
swing, and we have noticed that in m
gardens where this work is in progress
spores of Apple Canker are extremely ple
ful. Those of our readers who are troub
with Canker should examine the disea
patches at this period, when it will
found that the whole of the cank
areas are now studded with tiny,
pustules. These are the fruiting bodies
the fungus which causes Apple Canker,
contain spores which will start the dise
in new areas. Apple Canker is entirely
wound parasite, so that it must be danger
to be pruning, and so leaving open wou
on the trees, when so many canker sp
are present. The better plan would be
remove the cankered portions first and b
them. Those who have only a sm
amount of pruning to do might delay
work until later, but where the work is c
siderable it must be pushed on with, or it
not be completed in time.

In small gardens where birds are trou
some the pruning of Gooseberries should
delayed until much later in the season,
cause if the work is completed now,
then the birds take their share of the bu
the resulting crop is reduced. In such g
dens it is better to wait until the danger
birds is over.

Starting vineries

This is a very usual time for starting i
growth the bulk of Vines, more especi
where only one or two houses are devoted
the culture of the Grape. It is a mistake
start with a high temperature, as it is nec
sary to gradually increase the warmth
growth advances. For a start a night te
perature of 45 degs. to 50 degs. is desira
this being raised a little each 10 days o
fortnight. A moist atmosphere is always
advantage, encouraging steady, heal
growth and making it uncomfortable
insect pests.

REMINDERS FOR THE WEEK

Scotland

ch houses

e Peach is very easily excited into vth, so it is a mistake to keep unheated ses close shut with the idea of obtaining fruits earlier, for, although the trees are e hardy, the open blooms are not, and if ed into flower too early it is more than y that a severe frost may come along entirely destroy the chance of a crop. It etter, therefore, to rather try and retard time of blooming by keeping the house aired, day and night, rather than en-age early movement. It is, of course, e a different matter where the house is ed, as a little warmth can be afforded at time the necessity arises.

wberries in pots

hese are best on shelves not very far from roof-glass. Strong heat is bad for these ts at any time, but more especially when being started into growth. Keep the ts clear of Green Fly by an occasional rising with nicotine. Spraying overhead ine afternoons is beneficial, while a little le feeding may be given. On no account st the soil ever be permitted to get dry, or lew, Red Spider, and Thrip are almost ain to obtain a hold. Over-watering, of rse, is, likewise, very harmful.

in crop Tomatoes

a temperature of about 60 degs. can be ntained the main batch of this important should now be sown.. Use pots or pans are clean and well drained, filling these a nice light compost. Scatter the seeds ly and thinly, and cover with a little of soil. After watering with tepid water lay ece of glass over each receptacle and cover whole with a sheet of newspaper. Set in enial temperature of about 60 degs. As n as growth appears have the pots or pans ated quite close to the roof-glass and so ent the seedlings "drawing" up soft and y.

cing Kidney Beans

here suitable accommodation is available very popular vegetable should be grown pots for early supplies. Clean, well-ined 7-inch and 8-inch pots are the most able for the purpose, and these should be d only about two-thirds full with fresh, compost. Plant about seven to nine ds in each receptacle and cover to the th of an inch. The remaining space can filled in later with rich soil, which is a t benefit to the plants. A moist, lerate temperature should be aimed at.

t Lothian Stocks

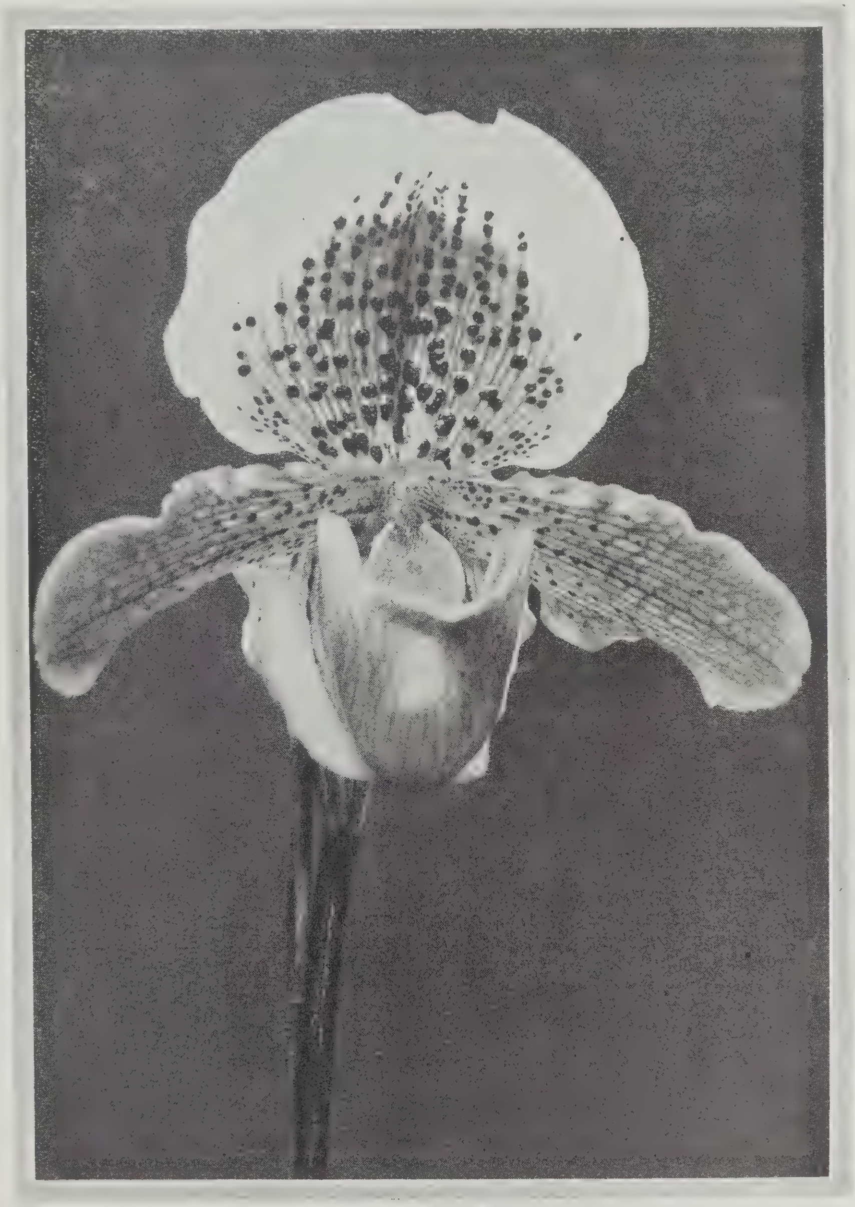
hen a good strain of this exquisite Stock vell grown there are few autumn flowers e beautiful and fragrant. If seeds be n now fine plants should be available for ing out just after the middle of May, and then have time to grow into large, hand-e plants and produce abundance of bloom. thinly in shallow pans or boxes and set temperature of 55 degs. to 60 degs. In earlier stages of growth damping-off is n very troublesome, and so to avoid this, y pricking-off is advisable.

e blue Primrose

his very lovely but rather troublesome ject gives, as a rule, best results from elling plants, although even with the finest ins a certain percentage of purple or lish shades will appear. To ensure ing fine plants before autumn seed should sown now in small boxes or pans filled h light compost. Set in a slightly heated pit or greenhouse, cover each box or pan with glass and paper, and in due course the seedlings will appear. They do so, however, as a rule, very irregularly, and as the weakest and latest seedlings usually produce the finest and bluest flowers none should be discarded until they have bloomed.

Polyanthus from seed

As with the Primrose, mentioned above, it is a good plan to raise young plants frequently, and by doing this under glass and early in the year much finer plants are assured, and these will yield a great profusion of flower next (1930) spring. Treat exactly as advised with the Primrose.



Cypripedium W. H. Page var. Grace, shown by Armstrong and Brown *(see p. 58)*

Sow Broad Beans

A small sowing of this useful subject should be got in as soon as ever the soil can be got in working order. A good strain of the old Seville Long-pod is very suitable for earliest work, being hardy, early, and prolific.

Sow earliest out-door Peas

This is a crop that one can never have too early, and as some of the varieties, notably The Pilot, are so hardy that even prolonged cold and wet fail to rot the seeds, a sowing should now be got in as soon as ever the soil can be got in workable condition. Select a sheltered south border, if possible, for this sowing.

C. BLAIR.

Preston House Gardens, Linlithgow.

Southern and Midland

Shrubberies

The pruning and thinning of flowering and other ornamental shrubs must now be taken in hand. There are, however, a few exceptions which should be left until later, and these include those actually in bloom, such as the Winter Sweet (Chimonanthus), Garrya elliptica, Erica lusitanica, Viburnum fragrans, and Witch Hazels, also Ceanothus, Buddleias, and those evergreens which are liable to get damaged by excessive frosts. First remove all dead wood and thin out the remaining growths sufficient to admit light and air to all parts, stopping down any strong growths which tend to overbalance the bushes. The cutting back to within a few inches of their base of a few of the older growths each year will encourage the formation of strong young wood and help to maintain the shrubs in a vigorous, healthy condition.

Bulbs among shrubs

Crocus, Snowdrops, Scillas, and other spring flowers are often used to carpet beds of Azaleas, and Lilies are wisely used between Rhododendrons, and if a light dressing of fine soil is applied at the present time over the whole surface it will prove most beneficial to them and also to the shrubs. Any odd soil will do, and quite a thin dressing will answer the purpose, which is that of holding down the accumulation of leaves, converting them into leaf-mould, and giving to the beds a tidy, finished appearance. Such leaves should never be removed, nor should the soil among such shrubs be dug over.

Herbaceous plants

Old growth should now be cut away, whether in the garden proper or in the wilder parts, including the fringes of streams and ponds, as the crowns of many are already prominent and may get damaged if left longer. The division and transplanting of such subjects may be carried out whenever the ground is in good working order, and the same applies to Alpine flowers.

Autumn-sown Sweet Peas

These have germinated better than usual, and the lines in the open ground are about 4 inches high. An application of soot and lime at intervals will serve to protect them from birds and slugs. Give plenty of air to those growing in cold frames when weather permits.

Open spaces in the foreground of shrubs

Spaces intended for colonies of annuals should be dug over deeply in order to admit of the frost pulverising the surface and thus render the work of preparation easier later. This applies particularly to heavy soils.

Spraying fruit trees

Follow up the pruning with spraying, and thus complete the winter's work. This will admit of the borders being dressed and lightly pricked over. Many favour caustic alkali, which is very effective in the destruction of Lichen and Moss. This should be used at the rate of 1 lb. caustic soda (98 per cent.) to 10 gallons of water. Always choose a still, dry day for its application. Glove the hands and wrists with rubber, and wear an old suit for this, as it is injurious to both skin and clothing. If insects and fungi have been troublesome I prefer lime sulphur, an excellent winter wash, which may be obtained already made up from horticultural sundriesmen.

Hotbeds

These should be made up of dry leaves and stable manure, and covered with frames before the soil is added. The latter may be about 5 inches in depth and of good heart. As soon as the testing-stick proves the heat to be receding, the seed of early French Horn Carrots, Turnips, and Lettuce may be sown.

Peas

Those sown during November in cold houses and frames are showing greater strength, and although plenty of air is advisable on mild occasions it should be given with care during very cold weather.

Brussels Sprouts, Onions, and Leeks

Those intended for early work and shows may now be sown in boxes containing well-prepared soil. After sowing and watering lightly with a fine rose stand the boxes on stages close to the glass in a house the temperature of which is maintained at 55 degs. to 60 degs.

Potato Onions and Shallots

These may now be planted, using well-prepared ground for them. The former should be put out at 1 foot between the sets, 3 inches deep, and 18 inches between the rows, and the latter should be merely pressed into the surface at 9 inches all ways.

Perpetual flowering Carnations

Cuttings inserted during December should now be rooted, and where these are in they may be hardened off to withstand l and air, before being potted up into 2- pots; no shading will be required at period. Continue to insert clean, hea cuttings as these become available, and a high temperatures in houses contai flowering plants, 45 degs. to 50 degs. at n being ample. E. MARKHA

Gravetye Manor Gardens,
East Grinstead, Sussex.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent tc press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plant be named should send fair examples of each— stem, leaf, flower, or fruit. (Snippets of le and points of shoots are useless.) Not more t four plants should be sent in any one week by same correspondent. Where more than one is sent they should be numbered. Of conifers cones should always be sent.*

Naming fruit—*Several specimens in diffe stages of colour and size of the same kind gre assist in its determination. Single, unripe, deformed specimens are difficult to name. do not undertake to name more than varieties at one time.*

GREENHOUSE

Cyclamen in the third year

I have a batch of Cyclamen in flower, raised from seed sown in August, 1926. I should be much obliged if you would advise me as to further treatment of same. I am under the impression that they will be useful again next winter, and would not be worth keeping for a third flowering. Mr. C. Blair gave a good article about a year ago on the raising of Cyclamen from seed to the flowering period, but I am doubtful as to after-treatment. REGULAR READER.

[After the plants go out of bloom set the pots in a cold frame and continue to give water in the usual way until the foliage shows signs of turning yellow, when supplies should be gradually diminished and finally stopped. Do not, however, expose the plants to the sun, but always shade them. After the foliage has quite died down remove it carefully, but still withhold water at the roots until growth begins to push up. A slight spraying overhead daily is good for them, and abundance of air must be given at all times. As soon as growth appears the corms can either be shaken free of the old soil and repotted into fresh compost or else a little of the surface soil can be loosened and removed, its place being taken with fresh, rich compost. Future treatment is the same as for young plants. The corms can be bloomed for several years, but the flowers get smaller, as a rule.]

Bud-dropping in Camellias

(Leytonstone).—The trouble to which you refer is not uncommon in the case of Camellias. Opinions vary as to its cause. Some put it down to over-dryness and others to too much moisture at the roots. Still others attribute bud-dropping to too much or too little heat while the buds are expanding. In your case, clearly, unripened wood has nothing to do with the trouble. You afford, however, a most likely clue by stating that, previous to being planted out, the Camellias were grown in 10-inch pots. As only this particular plant has been unsatisfactory it is highly probable that the ball of the plant, near the centre, had become dry, and when this happens it is almost impossible to moisten it thoroughly. Although the border may be in a satisfactory state of moisture inspection may reveal that the plant is quite dry at the centre of its root system. If it is possible to do so let the plant be lifted, and wash every particl soil from the roots with a hose, afterw replanting in fresh soil, which may added to it a little peat. This treatn ought to work a reformation. You ar be congratulated on the particularly hea and clean foliage of the specimen forwar

Primula obconica

My Primula obconica, raised from sown last year, are grown in 5-inch The leaves, both this year and in prev years, go yellow in patches. The plants watered either once or twice a week when the pots ring). Rain-water is and no manure of any kind is given. Pl are not watered overhead. The pl flower well, but are not very good except the first blooms. Please tell me how avoid the discoloration of leaves.

F. A. V

[The specimens sent for examination badly affected with Botrytis, a fungus w is common everywhere, but one whic usually a saprophyte and only rarely att living tissue. We are afraid that your control will be to burn the plants as cease to become useful, picking off the le that show the water-soaked areas, spraying the others with a weak solutio potassium sulphide might arrest the prog of the disease. With the evidence we it is somewhat difficult to account for fungus attacking Primula, and the thing we can suggest is that the rain-w used for watering the plants is contamin with the spores of the fungus concer If you are not in the habit of giving house in which the plants are grow thorough scrub down at least once a the dirty glass or woodwork may be cause of the trouble, or, again, the mat on which the pots stand may be harbou the fungus. A pure water supply coul assured by clearing out the container scrubbing it with a strong solution of manganate of potash or some other fectant. After this has been done rain-w might be allowed to run in again, but work of cleaning out the container shou carried out, say, once or twice a year you would like to send us the full cul details given to your Primulas we migl able to suggest cultural errors, if Primula obconica responds well to a weak manure and soot-water altern when the pots have become full of roots

FLOWER GARDEN

ceous border

n anxious to convert a shrubbery of
eens into a herbaceous border, and
red if you would advise me as to how
t the ground after the roots have been
out. The soil is heavy clay. I had
ed double-digging, putting manure in
ttom of each trench, and top-dressing
ime. If you think this would be satis-
I would be very much obliged if you
tell me whether to use slaked or quick-
and whether it is safe to apply it im-
tely before planting. O. C. M.

the soil is of heavy clay what is
as bastard trenching would be the
way in which to treat it. Double-
g is practically the same thing, but the
soil must not be brought to the sur-
f leaf-mould or partly rotted leaves be
ble put a liberal dressing in the
es, incorporating this with the subsoil.
the surface in a rough state until
ng time (end of March-beginning of
arrives, but, meantime, dress the sur-
vith freshly-slaked lime rather freely.
vill, of course, be raked in previous to
ng, and it will assist in the disintegra-
f the surface soil and make it fit for
ng. Manure at this time is not ad-
nor, indeed, is it desirable. As the
is being carried out see that all the
of the shrubs are cleared out to the
st possible extent. So treated the con-
shrubbery ought to prove a satisfac-
nome for the majority of such hardy
as do not call for special treatment.]

tmas Roses

M. M., Co. Cork).—It is evident that
Christmas Roses are starved and in
of lifting and replanting. Most of the
bores are most accommodating plants
ucceed in ordinary garden soil, but the
comes at length when they may collapse
nly. Therefore, when the leaves again
as they will most likely do with the
cing spring, lift the plants, thoroughly
or deepen the quarters, adding some
rubble and a proportion of leaf-mould
or of well-rotted stable manure, and replant. This ought to result in vigorous growth and abundance of bloom next season, and if the work be well done it ought to suffice for six or seven years.

Hardy Salvias and white stemmed shrubs

COULD you inform me of (1) a hardy blue Salvia which can be left out all winter in the milder parts of the country and (2) the white-stemmed shrub which was recommended some weeks ago in your columns as suitable for planting in connection with Dogwoods? G. C. D.

[(1) Salvia virgata is quite hardy and can be trusted anywhere through the winter. The colour, though usually called blue in plant lists, is not a pure blue but a purple-blue. The North American Salvia azurea should also serve your purpose, but it does not seem to be generally grown or offered in nursery catalogues. (2) The white-stemmed shrub for association with Dogwood may have been the white-barked form of Salix vitellina or a white-stemmed Bramble, the best-known of which is the Whitewashed Raspberry (Rubus biflorus). The white stems are most effective in winter. The white stems of the newer Chinese species, Rubus Giraldianus and R. lasiostylus are, we consider, even more effective.]

Above: **A large bed of the purple-flowered Salvia nemorosa virgata at Kew**

When in full bloom it is the source of great attraction to bees

: An herbaceous border at Kew, Crepis rubra, a pretty Hawksbeard, in the foreground

TREES AND SHRUBS

Privet hedge

(Regular Reader).—If very anxious to secure cuttings from the Privet hedge you could go over it with a knife and remove a shoot here and there. You can do this next month, or even in March. To ensure the hedge growing sturdy and well furnished right down to the ground you must trim it yearly. Cut back the young growths to about half their length in February or March.

Clearing out Poplar roots

(W. B., E. Dulwich).—The quickest way, in the end, would be to grub out the roots of the Poplars, and it would certainly be the most effective. If, however, the work is prohibitive, bore an auger-hole in each stump to the depth of 2 inches and fill the hole with salt or with weed-killer. In this case the roots, being left in the ground, would die, and most assuredly they would breed fungoid growths, which might be prejudicial to the welfare of flowers grown on the position. Such things as Nasturtiums or Poppies, which thrive on poor soil, might succeed, but, on the whole, you are strongly recommended, even at the expense of time, to grub out the stumps.

Trimming specimen Bay trees

(Regular Reader).—You may trim your plants in March or April. Leave a few buds on each young shoot, as hard pruning back gives a very stunted and artificial appearance to the trees. Use a sharp knife or secateurs and not the hedge shears.

MISCELLANEOUS

Awards at Flower Show

Will you, please, give a ruling, through GARDENING ILLUSTRATED, on this point. I was a visitor to a show some two months ago, and I noticed two exhibits in a class that had received their award with a Cup to the winner. Later I saw that the Cup had been taken away, and learned that the winner had been disqualified after protest from the runner-up for adding to the exhibit contrary to the wording of the schedule. I also noticed that the runner-up still retained second prize award. Was this right? Should not the second, which had complied with the rules, have moved up into first place? There is a rule which says that the first prize can be withheld if exhibits are not considered of sufficient merit, but this certainly did not apply in this case, for, in my opinion, it was the equal to the disqualified Cup winner. P. C.

[We hardly feel justified in giving a ruling in this case on the strength of the somewhat meagre information supplied. On the face of it it would appear that, in the event of a disqualification, the award should have gone to the next best exhibit, provided such exhibit was worthy of it, but it must be remembered that judges have power to withhold an award, and it is possible that, in this case, they had good reasons for so doing. At any rate, without a much fuller knowledge of the circumstances we should hesitate to pass a definite opinion on their judgment.]

Miniature Japanese gardens

(Kimona).—Small Japanese gardens in bowls, such as you require, may be obtained from Baggesens, Hardy Plant Nurseries, Pembury, Kent. Highly coloured Maples, including Acer Osakasuki and other Japanese forms, may be obtained from the same source.

Soot and lime

I put lime on ground last December. In February can I sow soot on same ground? I understand that lime and soot should not be used together. I am thinking of planting Gladioli on this ground. G. B. S.

[If lime has been applied to your garden last December you need have no fear of using soot on the same site early in February. Quicklime when fresh, added to soot, reacts with the ammonia contained in the soot, and the ammonia is liberated in the form of gas, which escapes into the atmosphere. The main use of soot is that it adds nitrogen in the form of ammonia to the soil. If the ammonia is lost into the atmosphere the value of the soot is wasted. After quicklime has been added to a soil it becomes gradually carbonated, and when fully carbonated its action upon soot is very slight. If your lime was applied as a top-dressing you should hoe the surface so that the material is thoroughly mixed with the top 2 inches of soil. Apply the soot in February. Repeat the hoeing and you will not waste any portion of the value of the soot.]

Treatment of old and weedy lawn

(An Ignorant One).—If the lawn in question is, as it appears to be, in rather a hopeless condition, the best remedy would be to trench it over and to sow it out with good grass seeds early in April. If this course be impracticable it may be dealt with as follows:—First, with a close-toothed steel rake remove as much of the Moss as possible, raking the lawn from top to bottom and from side to side. Then with a hand fork or a weed eradicator root out as many of the Daisies as occasion will permit. Even if the removal of these results in bare patches the work ought to be persevered with until, at least, the majority is disposed of. Then top-dress the lawn with finely sifted soil, and in April sow with grass seeds. After a good growth of young grass is secured a dressing of lawn sand applied according to the directions given with each bag may be applied, and this will, in all likelihood, dispose of the remaining Daisies. The renovation of an old and neglected lawn calls for patience, the work cannot be done in the course of a season, and, candidly, it is always preferable to "scrap" the present grass and to begin from the beginning.

BEES

Choosing a hive

FOR the last 30 years the hive used by the majority of experienced bee-keepers in Great Britain is that known as the W.B.C., which was designed by the late W. B. Carr, one of the pioneers of modern bee-keeping in this country. This hive has stood the test of time, and the largest recorded "takes" of honey in this country have been from this pattern. It has many advantages, especially to the beginner in bee-keeping, ease of manipulation being not the least important. Owing to its double wall—the hive proper being surrounded by an outer case with an air space between the two—the bees are kept warmer in winter and cooler in summer than would be the case with a single-walled hive. Again, it is so made that it can be enlarged upwards to any extent, a very important consideration in a good honey-flow.

The brood chamber is designed to take what is known as the British standard frame, which measures 14 inches by $8\frac{1}{2}$ inches. This frame was decided upon by the British Bee-Keepers' Association, after repeated experiments, as the most satisfactory size for this country.

Of recent years, however, a certain number of experienced bee-keepers think that this frame is too small, and are adopting the larger sizes used in America, which are known as the Langstroth and Dadant, measuring respectively $17\frac{5}{8}$ inches by $9\frac{1}{8}$ inches and $17\frac{5}{8}$ inches by $11\frac{1}{4}$ inches.

For some time past a long controversy has been taking place in the different bee-keeping papers, but no agreement has been arrived at. Many County Bee-Keeping Associations are now trying the different-sized frames in their experimental apiaries. English W.B.C. hives and the larger American patterns are being worked side by side under exactly similar conditions, but these experiments, to be of any real value, must be conducted over a series of years before any conclusive results can be obtained.

So far the experiments seem to prove that in a very good bee district and in an exceptional season the larger frame has certain advantages, but, personally, I think that with our uncertain summers and for most districts the original frame fixed by the B.B.K.A. will always hold its own. One great drawback to the larger frame is its additional weight when manipulating, no mean consideration in a large apiary.

It must be remembered that, though each frame has its advocates, the production of surplus honey depends largely on the skill of the individual bee-keeper.

I have used the W.B.C. hives in my apiary for the past 20 years, and at different times have experimented with the American type, but I am quite satisfied that in this climate of ours the former hive with the British standard frame is unexcelled.

Unless one wishes to experiment one type of hive alone should be used throughout the apiary, as it is most important that everything be interchangeable; roofs, lifts, floor-boards, brood chambers, supers, etc., should be of one size, so that one part of a hive will fit a similar position in any other. Interchangeability saves much time and temper, and, from an economic point of view, is essential.

The frames themselves should be t
with a groove in the top bar, the wax
tion being fixed by means of hot wax
wooden wedge.

Those usually sent with hives have
top bar to hold the foundation. Th
not nearly so satisfactory.

In choosing a hive buy the best.
are many cheap hives on the marke
are generally expensive in the long
good, well-made hive, if kept
painted, should last a lifetime.

The National Carnation a
Picotee Society

The Fiftieth Annual General Meeti
the above Society was held at 95, Be
Road, Victoria, S.W. 1 (by kind perm
of the London School Gardening A
tion), on Saturday, January 19th.
was a large attendance of members.

The Committee's 1928 Report discl
satisfactory state of affairs, the memb
roll having increased by 70 during the
and the balance in hand being over
as against £30 in the previous year
conjunction with the British Car
Society, a combined Carnation Exhi
was held at the R.H.S. Hall on July
and 20th, which was an outstanding s
and the Committee is pleased to report

to the happy relationship existing
n the two Societies, a similar com-
how will be held in the R.H.S. Hall
ar on July 18th and 19th. At this
exhibition the "Edith Drake" Chal-
Trophy for a vase of fifteen blooms,
riety or varieties, will be competed for
first time. This Cup, which is to
n three times in succession or four
n all, has been generously donated by
rake, an enthusiastic member of the
. Innovations in the 1929 schedule
so include new classes for fancy Car-
(other than white or yellow ground)
rdy border Pinks. The best thanks
Committee were accorded to all ex-
g members. The retiring President
dmund Charrington) was unanimously
ed in that position, with the hearty
of all members for his continued in-
hard work, and support, whilst Miss
r and Messrs. James Fairlie and J. J.
three of the Society's oldest and best-
exhibitors) were elected Vice-Presi-
Major George Churcher, for his many
ctions, was appointed Patron of the
. The meeting regretfully accepted
signation of the Hon. Secretary (Mr.
Lowe), at the same time expressing
nks to him for his whole-hearted
on the Society's behalf whilst hold-
t position. Mr. A. E. Amos, a Com-
member, was unanimously elected
n. Secretary of the Society, with Miss
Wells (re-elected) as Hon. Assistant-
ry. The Committee vacancies were
by Messrs. S. H. Gregg (London),
Child (London), E. G. Lowe (London),
Flindt (London), and A. Reynold
ngham). The meeting closed with a
vote of thanks to the President for
irmanship.

Awards to Carrots

The following awards have been made to the undermentioned Carrots by the Council of the Royal Horticultural Society after trial at Wisley.

LEGAL POINT

Sale of market garden

I let a 2-acre field which also contains 100 fruit trees to a market gardener for £12 per annum. He also has planted about 100 Currant trees and some Raspberry canes. The land is about to be sold. What notice is the tenant subject to? Also is he entitled to any compensation for the Currant bushes he has planted or for trade interference? There is also a rough shed on the premises.

F. W.

[The fact that the land is about to be sold makes no difference whatever to the tenant's legal rights. He is entitled to the same notice as he would have been entitled to if no sale took place. It is not absolutely necessary that he should have notice even now unless the purchaser desires it. If he has notice it will be 12 months' notice, and the compensation to which he will be entitled will depend upon the terms of the agreement under which he holds and upon the question whether that agreement is in writing or otherwise, as to which you give us no information.]

CATALOGUES RECEIVED

LATE NOTE

Rabbits barking fruit trees

Now that we are having some snow it may interest your readers to know how I stopped the depredation of these pests during a heavy fall of snow. I had a lot of young trees in an open orchard, and, in my desperation, smeared tar on two sides of the stems up to as far as I thought the rabbits could reach. This stopped them, and I could not see any ill-effect upon the growth of the trees afterwards.

W. ELGAR.

BY APPOINTMENT.

LAWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS'
LAWN GUANO
(A Compound Fertilizer)

e safest dressing for turf. It feeds the turf over a long period and will not burn
discolour the grass. Lawn Guano quickly strengthens the roots and encourages
lense growth of fine grass. As used by important clubs and municipalities. Apply
w at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.
Prices, in Bags: 7 lbs., **3/-**; 14 lbs., **5/-**; 28 lbs., **9/-**; 56 lbs., **15/-**
1 cwt., **25/-**. Carriage paid.

FISONS'
BASE FERTILIZER

ould be incorporated with the soil before sowing grass seed. Specially prepared
promote strong root growth and give new grass a good start. Use 4 ozs. to the
. yd. a few days before sowing the seed.
Prices, in Bags: 7 lbs., **3/-**; 14 lbs., **4/6**; 28 lbs., **7/6**; 56 lbs., **12/6**;
1 cwt., **20/**. Carriage paid.

FISONS'
LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed, such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.
Prices, in Kegs: 14 lbs., **5/-**; 28 lbs., **9/-**; 56 lbs., **16/-**;
1 cwt., **27/6.** Carriage paid

FISONS'
GRASS SEEDS

are the finest procurable, being specially tested before selection.
Special Mixture (for Bowling and Golf Greens, finest grasses only).
Prices, in Bags: 7 lbs., **15/6**; 14 lbs., **30/-**; 28 lbs., **58/-**; 56 lbs., **110/-**;
1 cwt., **210/-**. Carriage paid.

GEO. JACKMAN & SON - WOKING - SURREY

The Perfect Surface!

MOUNT BRAISWICK COLCHESTER

(Photograph by courtesy of Mrs. Biddulph.)

The following letter refers to this COLAS Drive. It speaks for itself.

"You may be interested to hear what a wonderful success the Colas is on my drive. The drive slopes down from the road to the house, and is overhung with big trees and was always soft and wet, and my car, being large and heavy, ploughed it up every time she went over it. I spent over twenty pounds on the drive last year, and this year the builder said the only thing to do was to have it all up again and make a new foundation. However, I thought I would try Colas first, and now the drive is perfectly hard and firm, and in spite of these late heavy rains the car makes no impression on it—and this only at the cost of two drums of Colas."

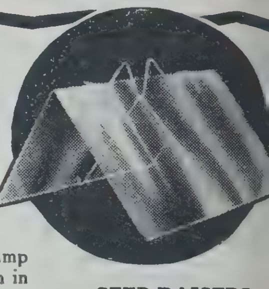
yet the difference they make!



Protection from cold, wet, wind, and birds

WE ASK the experienced gardener to consider our System on its practical merits. Experience proves the CHASE CONTINUOUS CLOCHE a valuable tool in the hands of the grower.

Not French Gardening.

This is not French gardening, but a complete system for getting earlier, bigger, better crops of flowers and vegetables from sowings or plantings in the open ground.
The CHASE CONTINUOUS CLOCHE provides effective protection from birds, cold, excessive damp and wind. All seeds usually sown in the open may be got in, a month or six weeks earlier than usual, and covered with the cloches Germination is far surer—you save seed—and get crops on weeks ahead. Annuals sown in position and protected with the cloches make sturdier plants than those out of boxes, and give a wealth of bloom.
In autumn the cloches are used to carry over crops sown in late summer, and as a winter protection for all plants that tend to suffer from the continued effects of cold and wet.

SEED RAISERS

"Seedraiser" or "S" size cloches cost under 4d. per foot run of row. Full particulars in free list.

LOW PRICES

A set of 52 "A" size cloches as above, to cover 60 ft. of row, costs 45/- carriage paid. Half quantity at 30/- and trial set 17/-. Please send now for illustrated list.

Clean Trees mean Clean Fruit

The best time to attack a pest is in its egg or ova stage; it is then stationary and more "get-at-able," and a higher concentration of wash can be used without harming the tree.

Abolene is the ideal dormant tree wash. It clears away moss and lichen and destroys Insects' Eggs. In recent trials trees sprayed with Abolene produced the heaviest crop of Apples.

Pint, 1/6; Qt., 2/6; ½-Gall., 4/6 Gall., 7/6.

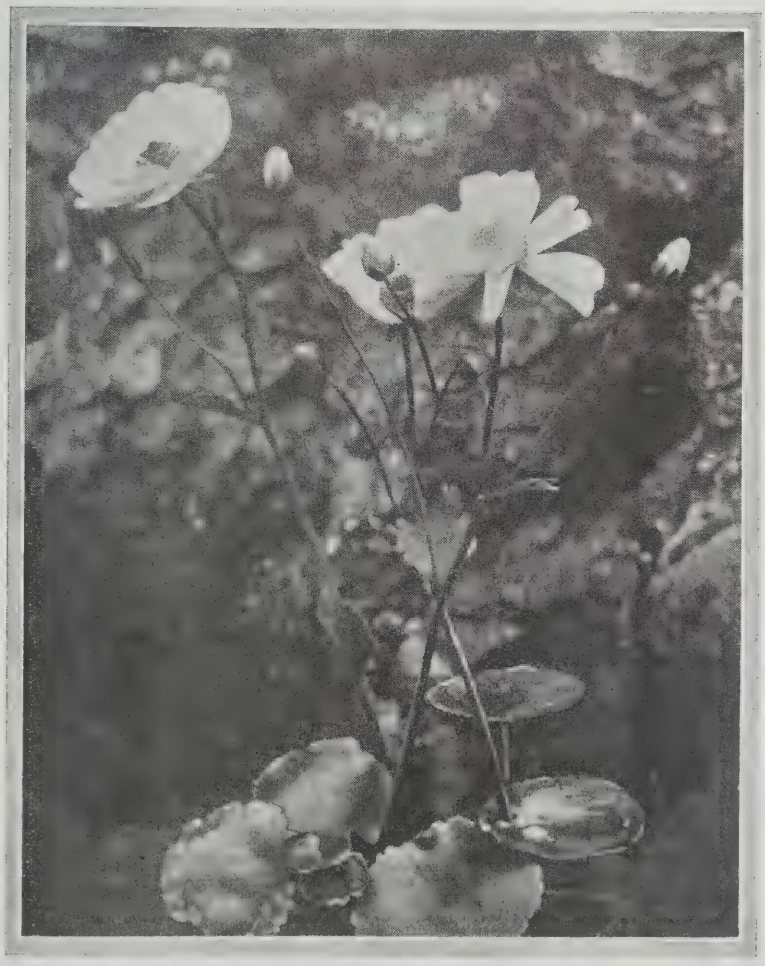
Ranunculus Lyallii

SEE that Ranunculus Lyalli is getting
me attention at present in your journal,
d a note, therefore, about this plant
one who has seen it growing by the
in its New Zealand habitat, who has
collected it and grown it in his garden
fair success, may be of interest, and
helpful, to those who would fain add it
eir garden flora. I think I have seen
oliage described as "sword-like." There
thing, however, of the sword about this
rcup—of the shield, rather, the leaves
what botanists would call peltate. Each
if flattened out, would approach the
lar, but the web of the leaf slopes up-
from its junction with the stem, and
s a cup or funnel, like the bowl of a
sh wine-glass. Indeed, in the Southern
of New Zealand, where one
times gets woefully thirsty,
ve more than once been
to use it as a cup. The
mounted on a strong stem
t or more in height, is stiff
eathery, of a dark, polished
on the upper side, but, as
ost plants, paler on the
r side. If it produced
ng but leaves this Ranun-
would look distinguished
g the handsomest of our
e plants. But, though
eaf is handsome, the blos-
is the thing. In early
ner—October or November
plant shoots up a branched
some 18 inches or 20
s high, each branch bear-
its quota of Buttercups,
of them as large as a
n-piece, though, as in all
inflorescences, there are
rs of various sizes, the
nal blooms being the
st. There is little about
flower to suggest the
ter," which has given its
to our meadow Ranun-
, except the stamens,
h are yellow enough. The
s are solid in substance
f a colour which has been
ibed as "snow-white."
e they certainly are, but as
member the flower (if one
split a hair) not the dead
of snow, but rather the
er white of swan's down.
Lyallii is a mountain
r. New Zealanders—who
d it as the Buttercup of
rcups and as one of the
glories of their Dominion
l the flower, regardless of
botany, a Lily—"Mountain Lily," or "Mt. Cook Lily." After all, the English word "Lily" has ceased to be the narrow equivalent of the botanical Lilium, and when we have ceased to call "Convallaria majalis" "Lily of the Valley" it will be time enough for New Zealanders to consider whether they ought not to call their flower "The Mt. Cook Ranunculus." Meantime—Lily or Ranunculus—it is a mountain flower in the strict sense—I would say, from my own experience, a glacier flower; and it remains yet to be discovered by patient experiment whether it can be induced to live permanently away from the eager air of its native glacier valleys. Though I have not seen R. Lyallii in all its habitats I think I am right in saying that where it grows luxuriantly it has its fleshy roots invariably anchored in moist detritus with, as often as not, a sprinkling of light Moss growing over them. On one occasion, in botanising Arthur's Pass, where the Province of Canterbury passes into that of Westland, I remember exploring a shallow ravine or watercourse which ran pretty well east and west, so that while one bank was well exposed to the sun the surface of the opposite slope got little direct sunshine, or none. On the moist, shady side the Ranunculus grew strong and in abundance, while on the drier, sunny side there was not a plant. It does not, however, follow from this that the Ranunculus should be planted in shade, but that its foothold should be cool, moist, and well drained—should have, in short, very much the conditions needful for growing Japanese or Himalayan Lilies. In our hemisphere a well-constructed scree, I should think, quite in the open and sloping easily to the north, would be ideal for this flower, yet more ideal, perhaps, if a thin coating of some variety of loose Moss could be induced to grow over the roots. I grew and flowered this Ranunculus easily enough in the Province of Otago, in the south of New Zealand, where the climate is not markedly different from that of England, but it required watching to ensure that the needful conditions were kept up.



Ranunculus Lyallii, a mountain flower from New Zealand

Failing a sufficient supply of root moisture the leaves in time would shrivel, while, on the other hand, stagnant moisture would be fatal. R. Lyallii is not a bog plant. A cool anchorage in moist grit, always moist but never boggy, on an open slope trending north is, in my opinion, the recipe for growing R. Lyallii in this hemisphere. I do not know whether there has been any success with this plant at Kew or elsewhere in this country. It is not exactly an easy plant to establish, even in its native home, and I cannot conceive its thriving in a snowless, iceless climate like that of Auckland, though it is unsafe to dogmatise as to what plants will or will not put up with. So far as latitude goes, any part of Great Britain or Ireland should suit this Ranunculus, provided care is taken to provide the needful conditions of a cool, gritty foothold, pure air, and sufficient moisture.

If it is to be established in this country it must, of course, be either by raising seedlings or by importing roots. The Ranunculus seeds abundantly, but as I have never attempted to raise it from seed I can only say on this point that as the plant in its native habitat spreads abundantly from seed it should be easily possible to raise it from imported seed, always provided that the seed is freshly gathered at exactly the right time and transmitted to this country in such a way as to protect it in transit from too high a temperature—say, in cold storage. As to importing roots, I see no good reason why this should not be done successfully. The plant has completed its season's growth by March or April, and if the strong, fleshy roots (almost like the rhizomes of an Iris) were lifted then, suitably packed in some moist, gritty material, and shipped in cool storage, they should reach this country as full of life as when they were dug up. The rest would be the business of growers here.

I should like to correct the notion—if such a notion exists—that R. Lyallii is the only handsome New Zealand Ranunculus. There are well on for 30 species of New Zealand Buttercups, and possibly a few remain still to be discovered. Many, perhaps most, of these species are of only botanic interest, but several, though they do not equal Lyallii, come within measurable distance of that noble flower. R. insignis, for instance, which I have myself grown, is a bold plant after the Lyallii pattern, but with flowers of a varnished yellow. R. Buchananii is a large and beautiful cut-leaved species which I have never myself grown, but have seen in cultivation. It has white flowers as large as those of Lyallii, but, as I remember it, with narrower petals and a slight tinge of colour.

I should be glad to think that R. Lyallii had become a permanent denizen of the best British gardens (it will never condescend to any but the best), but anyone who wishes to achieve its successful importation would be wise to get in touch, if possible, with someone at the other end who knows all about the plant, where to find it and how to grow it, whether by transplanting or from seed. No doubt there are several such, but I know only of one, whose name and whereabouts I hope I do nothing amiss in mentioning—L. Cockayne, Ph.D., F.R.S., Government Buildings, Wellington, N.Z. Dr. Cockayne is as skilful a gardener as he is an accomplished botanist. A. W.

NOTES OF THE WEEK

New President of the R.H.S.

As we go to press we learn that the Council at their meeting on January 29th elected Mr. G. W. E. Loder President of the Royal Horticultural Society. Mr. Loder is one of the best-known horticulturists in the country, and his beautiful garden at Wakehurst, Sussex, is rich in Rhododendrons, Heaths, New Zealand and Tasmanian trees and shrubs. For many years Mr. Loder has been a member of the Council of the Royal Horticultural Society, and he is the President of the Horticultural Club.

Starting tuberous Begonias

THE tubers or corms may be started any time during February, March, or April, and the best method is to place them in shallow boxes containing nice light soil consisting of one part each of loam, leaf-mould, and a half part coarse sand. Do not cover the crown of the tubers, and water very sparingly until they start into growth. When the shoots are about ½ inch long put into 4-inch or 5-inch pots, according to size of tuber, using a nice light potting compost.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Begonia Lord Lambourne, a noble variety not unworthy of the name of the late President of the Royal Horticultural Society

The colour is of a pleasing shade of deep salmon-orange. The flowers are of perfect Camellia shape, and the colour is well retained. A.M., R.H.S. Tubers should be started in shallow boxes containing potting soil any time during February, March, or April

Begonias as house plants

THE two experiences as to whether Begonias in pots are suitable for indoor decoration are interesting.

As an amateur grower of Begonias, and with due respect to Mr. Greaves, I should be very sorry to see any of my plants taken from the greenhouse to decorate the house, even for a day or two; and I think Mr. Blunsden will agree that if the plants were so treated, they would be finished so far as further blooms are concerned, and might as well be set aside for the season.

I note Mr. Greaves finds it easy "to maintain a house atmosphere thoroughly congenial to tuberous Begonias." I am afraid my house-proud partner would object to my damping down floors and surroundings, which Begonias so look forward to in hot weather. My object, however, in penning these lines is to mention a point missed by your correspondents, namely, that if Begonias are required for decoration, why not
them in wire baskets? hanging them
the greenhouse (or better, in the cons
tory), or, if the danger of frost has pa
in any loggia or outside section of the h
where they will be protected from rain.
or three 10-inch wire baskets, furnished
with three basket Begonia plants of colour each, are a picture to enjoy, and
attention to watering and taking off
blooms, will last all the summer.
varieties as Joan (coral red), Mrs. B
(salmon orange), Meteor (scarlet), G
(dark red), Betha (salmon pink), and G
Shower (William Allen Richardson co
are all suitable. H.

—— It is one of the failings of hu
nature that we always consider a writer
ticularly discerning whose opinions coi
with our own, and, on the whole, I
agree with Mr. Blunsden's letter in your
of January 5th that double Begonias d
make good house plants. My long ex

is that after removal from greenhouse ving-room they show considerable de- ration. If a tuber has been started and ght on in a living-room, which is quite ferent matter, it will probably do fairly if kept near a window and properly at- ed to, but to remove a plant when in full n from a greenhouse to the dry atmo- re of a living-room is asking for trouble. ever, it is inadvisable to be too dogmatic, it is not given to everyone to grow nias to perfection, and I still hold the that the one who discovers the means eby double Begonias may be kept in per- condition after removal from greenhouse om when in flower will be a benefactor egonia lovers, and his fame should echo the corridors of time.

W. J. Robinson.

Iris stylosa

was interested in reading the letter by rset ” in your issue of January 19th, as, seeing the article by the French corre- dent alluded to, I decided to experiment e lines suggested.

have five clumps of this Iris in a dry er against a wall facing east-south-east, ey get a maximum of sunshine during whole year. Three of these clumps I cut as low as possible, leaving the remain- two uncut. At the time of writing, it ars that cutting off the leaves tends to ase the number of blooms; it most cer- y advances the period of flowering com- d with that of the uncut clumps, as so he blooms I have cut (about two dozen) been only from the clumps so treated. t a fortnight since I had a bowl of 12 ns.

the weather in Dorset has been as cold e have had it in Kent since the end of mber, with the exception of odd days, what is of still more importance, as lack- in sunshine, I am not surprised that rset ” has only cut 17 blooms. I have carefully examined my clumps and find the “ treated ” ones are showing a good ly of buds which only want warmer and ter weather to develop, while those treated ” do not look so promising. ever, I think it is a little too soon to e an accurate or fair comparison be- n the two methods, and intend later on ve the result of my experiences.

“ Dorset ” is also interested in the varie- of Iris other than Stylosa, might I sug- in case he is not already a member, that hould join the Iris Society, and thereby, les having other privileges, be in a posi- to obtain useful information from its ications. The Hon. Secretary of the ety is G. L. Pilkington, Lower Lee, lton, Liverpool.

F. Burton.

ildenborough.

Hybrid Ricardii Irises

nce the unfortunate accident which d the Royal Horticultural Society of its etary articles in the horticultural Press ng with Irises, on which Mr. Dykes was ibtedly one of the outstanding authori- have been few and far between. It is eshing to see that space in the columns ARDENING ILLUSTRATED has recently been to a genus which is gaining favour dily with the gardeners in this country. contributor in the article dealing with rdii hybrids raises several issues which ome measure may be thought to be a rrent to the cultivation of this particular s of hybrid Iris, and some may not agree a trap is lying in wait for those who r from catalogues. One can only speak e issues raised on his or her personal rience, coupled with information ob- from others who grow the same varie- under dissimilar conditions.

Monsieur F. Denis was the pioneer of this class of Ricardii hybrids, and nearly 14 years ago the following varieties—R. Fonce, J. B. Dumas, Professeur Scheubel, Gernaz Troost, Flavescens x Ricardii Mme. Boullet and Clement Desormes, from his garden at Balaruc les Bains, came into my possession and were planted in sandy loam in the hottest part of my small garden facing due south and sheltered by a greenhouse on the east. The existing soil was about 6 inches above the adjoining path, and, before planting, a quantity of old mortar and bone-meal was thoroughly incorporated, and the plants thrived well in this position, increasing moderately.

The plants, however, were not free in producing flowers, although otherwise they were healthy, but had a strong tendency to throw out long rhizomes. Owing, probably, to insufficient vigour the flowering stems did not show in satisfactory quantities.

The garden of M. Denis at that time at Balaruc enjoyed the heat which is associated with the shores of the Mediterranean. Moreover, the soil was of a heavy nature, and these two factors, coupled with lime (which these hybrids require), are the conditions which induce these plants to grow strongly and bloom freely.

Now, it will follow that in this country it is difficult to find a spot hot enough to grow these hybrids in heavy soil, as they refuse to grow in such a medium if cold. A light soil fattened to some extent will give the vigour that is essential to free blooming, and this seems to be the best compromise. These requirements should not be sufficient to condemn the race as delicate, although they are not so hardy as ordinary hybrids. North of London it would appear that, unless these hybrids are treated as greenhouse plants it is better to try something that will give some measure of success as an outdoor plant until it can be demonstrated that hybrids with just a streak of Ricardii blood will stand the English climate generally.

The above remarks are based entirely on personal experience with hybrids of Ricardii. With regard to hybrids of Mesopotamica, these are not quite so fastidious in their requirements.

With regard to your contributor's suggestion that it would be as well to put Ricardii hybrids in a class by themselves, while there might not be any difficulty in so placing original first crosses, in the secondary and tertiary crosses with a lesser quantity of Ricardii blood in them such a classification would become complex and lead to similar confusion as arose on the old grouping system.

Quite a number of Ricardii hybrids suffer from having weak stems, but in subsequent crosses this defect often disappears. The lack of flowers would appear to be caused not by spring frosts, but rather from the rhizomes not being sufficiently vigorous to throw flowering stems. The large flowers, tall stems, colour, and scent are features which tempt the hybridist to continue his experiments in an attempt to improve and add to the genus which in the end may be a complete justification of the endeavour.

The list given on page 2 of Mr. Helling's article of Ricardii hybrids is by no means complete, but the varieties quoted may be regarded as quite a representative selection which includes practically all the best.

In conclusion, it would appear that those who have in hand the classification of names have quite a stiff task without further suggestions for classifications of kinds or varieties, and when the classification of names assumes a definite shape (and this will probably be some time ahead yet) then it may be desirable to take on further trouble.

W. Sadler.

Meconopsis Baileyi and Primula Florindæ

The letter of your correspondent, “ Clay ” (issue January 12th, page 23), on the variation in colour of Meconopsis Baileyi, savours of the machinations of that libellous old dame, Madam Gossip, for it is with a little of truth, leavened with a touch of venom, and spiced with “ whisper it softly,” that she usually proceeds to malign the reputation of her hapless victims.

Presumably “ Clay ” has singled out this beautiful Meconopsis as being the latest comer, for he might have extended his tirades and included the majority of blue flowers in cultivation, and certainly all the blue species of Meconopsis, for Meconopsis Baileyi varies no more than the other species.

Before condemning any blue flowering plants, it is well to bear in mind that blue is affected by local conditions, probably more than any other colour in flowers. Every gardener knows that by rendering the soil acid, the pink variety of Hydrangea hortensis may be changed to blue, but how few give it a thought that the reverse is also possible, and that blue flowers whose natural habitat is lime free, might just as easily vary in colour when grown in a calcareous soil. In such cases it is the growing conditions which are at fault, and not the plant

In nature, Meconopsis Baileyi is a plant of the woodland, and bright sunshine might also affect the delicate toning of its faultless blue. In common with other Meconopsis, M. Baileyi does vary slightly under cultivation. At Bodnant it may reach 10 per cent. of the plants, but these variations are of a not unpleasing shade of mauve (very similar to the best shades of mauve Sweet Peas). These plants would be appreciated, but for the fact that they are entirely out-dazzled by the glorious sky blue of their neighbours. I have never seen the horrid dinges, slates, and purples which “ Clay ” mentions, and one wonders whether he writes from actual experience, or only from hearsay, or imagination. If he does write from experience, it would be interesting to know under what conditions the plants were grown.

Meconopsis Baileyi was first shown at Chelsea in 1926, when we exhibited not a single flower, as “ Clay ” states, but a dozen plants. These were not selected for their colour, in fact they commenced their journey to the show whilst still in bud.

In describing the colour of the species as sky-blue, growers have followed the lead of its introducer, Capt. Kingdon Ward, whose judgment is surely unchallenged. His description is not based on a few plants, for he mentions in his field notes that he found it abundant everywhere at Tsela Dazong and Doshong La.

Meconopsis Baileyi or betonicifolia (I believe that the authorities of Kew and Edinburgh have now agreed that the latter is the correct specific name) is one of the finest introductions of recent years, and grown under rational conditions, its beauty will survive any criticism.

When criticising Primula Florindæ, “ Clay” does not mention its outstanding merits as a late flowering Primula. It is an adaptable plant, and if its coarseness is objected to, this may be tempered by reducing rich food. It makes a brave show after the glut of Primulas is over, and shares with Primula Mooreana the honour of continuing the display well into the autumn months.

“ Clay ” asks for truth in advertising, but if his descriptions of Meconopsis Baileyi and Primula Florindæ are meant to act as an example, one can but feel grateful to both the Horticultural Press and Trade for erring on the charitable side, for if they followed "Clay's" lead, we might be tempted to banish many beautiful plants from our gardens. Everyone with experience of plant breeding must admire the care and trouble which our nurserymen and seedsmen take to produce true stocks, and marvel at the success which they attain, but the time when they will be able to accurately catalogue what all seeds will produce is, I hope, far distant, for then plant breeding will have lost all its thrill, and gardening will sink to the commonplace of the machine made article.

F. C. PUDDLE.

Bodnant Gardens,
Tal-y-Cafn, Denbighshire.

Rose Mabel Morse

In reply to N. Leslie Cave (issue December 15th), as I have not seen any response I would like to give a few words in favour of this beautiful Rose. The writer wished to hear from an expert on Roses, but I do not profess to be such. I will give him my opinion by experience. I had two beds in a Rose garden which had done very poorly. I planted these two beds, one with yellow and the other with red Roses. The soil is a heavy clay with which I worked in six barrowloads of leaf-mould before planting. I had five varieties of yellow Roses, of which Mabel Morse was one, and, may I say, one of the best. I had it alongside Christine, Shot Silk, Mme. Ravary, and Rev. F. Page Roberts, and I must say it kept its place along with all of them.

I might mention that the gardens here are 900 feet above sea-level, and blooms were cut of Mabel Morse along with the others in November, giving a good show all summer and autumn, and special notice was taken of them by visitors from more favoured districts. As far as I am concerned Mabel Morse is "worthy of its reputation." The low-growing tendency "N. L. C." complains of is not altogether "crawling," or a very bad fault, as most Rose growers like to get growth as low as possible in bedding Roses, since nothing looks more ugly than long, bare branches, showing all the ground of the Rose bed. I am still on the look-out for other readers' opinions.

K. M. RANKIN,
Head gardener to the Right Hon.
Lady Invernairn of Flichity.

Inverness.

Proposed Society of Garden Architects

The interesting letters on this subject will no doubt be the means of further correspondence, which will give some useful information. Your correspondent (page 35), questions whether such a Society is really wanted. Surely the call for such comes from those who have the qualifications, and who make garden designing their profession. We may well ask, What are the due and approved qualifications? It will, I think, be readily admitted, that some of the objects in garden design, or improving and making interesting and beautiful an existing garden, are to use the technical knowledge and the æsthetic sense of the designer to give a harmonious and restful feeling together with right grouping of trees, shrubs, and plants, which will contribute to this object, which takes years to acquire, even when the designer has a natural aptitude and an artistic sense. Also the necessary knowledge to grow successfully the many beautiful trees, shrubs, and plants which now go to make pleasant pictures in the garden of to-day, which can only be accomplished after many years of experience, and under varying conditions. How are these qualifications to be revealed to the proposed Society? Surely an examination paper and viva voce would be necessary to form part of the preliminaries to the acceptance of members who are to benefit by the status given to them by being members of such a Society?

St. Leonards. F. A. L.

Sternbergia lutea

THIS has flowered best with me in a dry border close to the roots of a Banksia Rose. When covered by summer growth it has not flowered at all, in spite of being under a hot wall.

A. M. A. H. ROGERS.

St. Hugh's College, Oxford.

—— It is with much pleasure that I have read the further correspondence on this subject, and one is happy to have elicited so many experiences. The fact that the Sternbergias generally flower well the first year after planting shows that they appreciate a period of rest, which they cannot always receive if left in the ground in many parts of the British Isles. There are other bulbs which give similar results, one of which, Crocus sativus, is a greater puzzle, seeing that it was at one time so largely cultivated as the Saffron Crocus. Scilla peruviana is another. One thing I should like to discover, and that is the effect of lime in the soil with S. lutea.

The large yellow-flowered Sternbergia macrantha from Asia Minor

The flowers of this species are leafless, arising from long-necked bulbs as in the case of Colchicums

Another is whether the narrow-leaved form called S. angustifolia is more free-flowering than the ordinary S. lutea. I am of opinion that it is, but it does not appear to be differentiated by most writers and bulb dealers, although the late Mr. John Weathers does so. By the way, that good authority stressed the point that the bulbs of Sternbergias should never be removed until the leaves are withered. Of course, I would only suggest lifting and resting the bulbs where the Sternbergias did not flower.

S. ARNOTT.

Rock Gardens at Chelsea

Who would have guessed that all this
and fury would result from Colonel
ham's letter. As Secretary of the R.H.S
wrote very tactfully, suggesting that
Council would be glad to see a little
variety in the stone used by Rock Ga
Exhibitors at Chelsea. Mr. Dillistone
written at considerable length, and
Wood very much to the point. Somel
wrote something in rather doubtful
about the Council, and an optimist w
to say that exhibitors had only to ask
Council to abolish Awards, and Lo! Aw
would be abolished. Best of all has
Mr. J. Wood making witty rings round
Dillistone's injured dignity. I would
to make a confession. Mr. Dillistone acc
Mr. Wood of being the earliest offende
this matter of using waterworn Limes
at the International in 1912, and Mr. W
admitted the soft impeachment; but my
sins go back further than that. I used w
worn Limestone at the Temple Show in
and I have used it ever since. True, it
only a modest half ton or so, arrange
raised tabling, but it was in the days
Virgin Cork Bark was still in vogue,
therefore, perhaps, interesting as the
thin end of what has since become a
wide wedge. I will not say the thinnest
of the wedge, for it is possible that s
one will claim that he sprinkled York
Limestone Chips on his exhibit even ea
in the Stone Age. Mr. Wood was, of co
the first to use waterworn Limestone
large scale. I agree with Mr. Wood
this beautiful rock has become terribly h
neyed, but what is perhaps even more
tressing is what he was, no doubt,
modest to mention, viz., the repeated i
tion by others of his own inimitable
of using it. Captain Symonds J
originated a manner of his own some
ago, the dramatic cliff of Cheddar, an
mystic pool, and very refreshing it was
this, too, has been mercilessly copied.
seems very unlikely that exhibitors will
up using waterworn Limestone as lon
the R.H.S. continue to insist on judging
Gardens for graduated prizes. It is th
rock above all others which lends itse
pretty building, can be obtained
weathered, and which seems to mak
irresistible appeal to the judges. I am
ing myself to break away from water
Limestone this year, as I have found a
ready weathered and of good colour.
with my own exhibits I have always
my own way, trying to show good A
and rock plants as one might grow the
a Rock Garden at home. The judges
not always liked my efforts, though I
gained a fair share of approval from
whose opinion I most value. There has
a lot of dreadfully serious talk on the
tion of rock gardening about "
"artist," "geology," "Nature's w
"self expression," and goodness knows
else. Personally, I am content to rem
gardener, trying to help good plants t
press themselves. Very early in the
Age Mr. Wood was a realist, making
Yorkshire pictures in rock in which eve
retrained use of Alpines seemed an off
I twitted him about this, saying that, s
a piece of Yorkshire moorland was
exhibit, all one expected to see o
was a goat. Next year he proved my
tention by having two goats browsing o
Chelsea Rock Garden; hence, no doubt
R.H.S. rule that animals are not all
on exhibits. His more recent work has
freer, less imitative, and surely better.
so terribly like scraps of Yorkshire
make Alpine plants look illogical and o
place. I strongly agree with Mr. Wood

t would be a good thing if the Council of he R.H.S. would consent to abolish the disribution of prizes among the Rock Gardens it Chelsea. Entries would not, I am sure, e affected (if that is what is worrying them), nd the tendency would all be towards the reater variety for which they are asking, nd less of the repetition of one theme, in one ind of rock, which they deplore. If, hower, Cups and Medals must continue, I uggest that a system of "pointing" be nstituted, and made known among both udges and exhibitors, so that exhibitors may now what to expect from the judges, and he judges may know how to deal with xhibitors. As things are now, the exhibitor —if he is out for prizes—has no idea vhether prizes are being awarded for acrege, volume of water, quality of turf, weight f cement, comic effects or deadly serious ffects, Alpine plants or bedding plants, tender, hardy, or no plants at all—just chips.

This little controversy has done me, at any ate, one good turn. It has encouraged me o go more thoroughly than ever before into he question of source of supply of rock for Rock Gardens, with the result that I hope efore long to have a very complete list of uch sources of supply, and so be able to end stone from the nearest possible suitble quarry to wherever it is needed.

Stevenage. CLARENCE ELLIOTT.

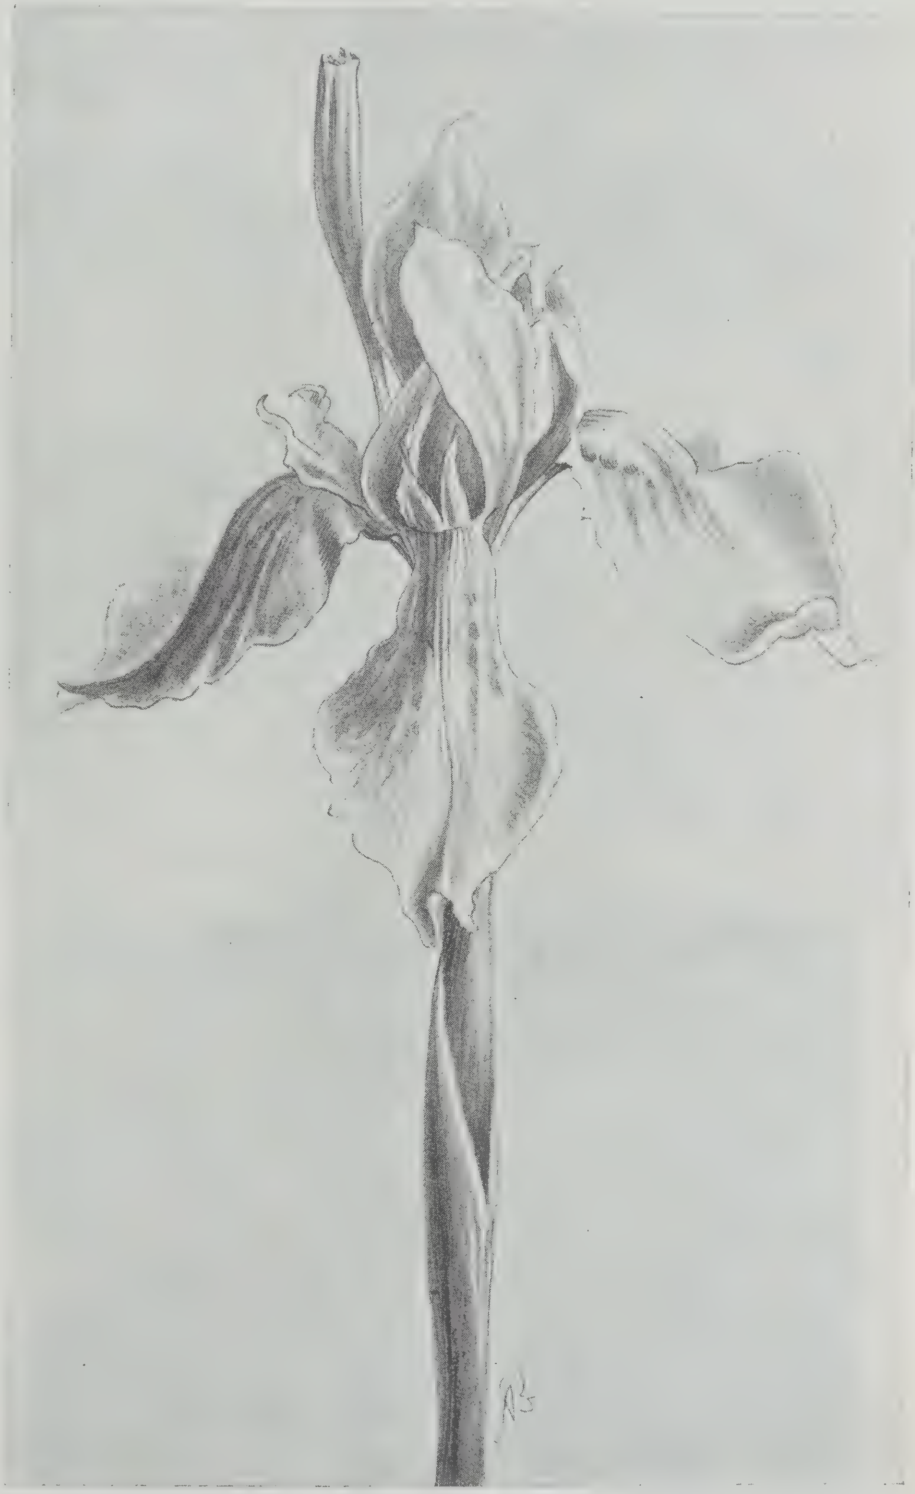
Dietes spathacea

THE genus Dietes was found by Salisbury to hold those species of Moræa in which the rootstock is a short rhizome nstead of a tunicated corm. That is the otanical way of stating it; in garden talk we nay say Moræa and its near relations have ascinating little bulbs with tough jackets of ery interesting patterns. Some of them re ribbed and netted with a variety of titches worthy of a modern pullover.

We should be wrong about the *bulbs,* for nside those jackets are solid *corms;* that is o say, shortened *stems* in which starch is tored, and not a collection of thick scales, vhich are *leaves* fattened up for the winter o hold the stores. Anyway, it is better to se the name Dietes for this group, as it so appens that all the plants with this running hizome also possess tough, evergreen eaves, and so differ at a glance from the eacock Iris Vieusseuxia (or Moræa) laucopis and the brilliantly coloured true Ioræas of the Cape, none of which are eally hardy in England, although they die own for their resting season.

It seems curious, then, that three of these vergreen Dietes can be grown in the open n the southern counties, and the subject of his note, contrary to general garden exerience, is at once the handsomest and the ardiest. It has been confused with a plant f earlier introduction, D. Huttoni, figured n the Botanical Magazine for 1875 at t. 6174 nd in "The Garden" of August 24th, 1889.

As the late Mr. Elwes pointed out in "The ardeners' Chronicle" for May 6th, 1916, ne leaves of D. spathacea grow to a length f 5 feet or 6 feet, those of D. Huttoni to bout 2 feet. Whether or no there are sufficent botanical characters to distinguish nese as two species, they are very distinct or garden purposes. I have grown both for nany years, and consider D. spathacea is ne of the most beautiful of fairly recent ntroductions, both for the border and for utting. Its clear yellow flowers are more nan twice the size of my form of Huttoni, re thrown up on taller stems, and their falls o not buckle and roll as do those of the esser plant, but spread out at just the right ngle to make a good contrast with the tandards.



From a drawing by E. A. Bowles

Dietes spathacea

I never think the flowers of Huttoni large enough in comparison with their rather clumsy spathes to be worth gathering for a vase.

D. bicolor, with sulphur flowers marked with a deep brown blotch on each fall, is a lovely species. It has lived here planted at the foot of a south wall, but hardly ever flowers. In the late Captain Pinwill's wonderful garden near Truro it was never without flowers for many months. It behaves as generously here planted out in an unheated house alongside that fine variety known as Johnsonii of D. iridioides, whose large white flowers blotched with yellow on the falls and with lilac styles rival those of I. unquicularis in beauty of form. This is a fine plant to grow in a pot for plunging out in summer. One thing is important to remember, the flowering stem should never be cut off, however untidy it may look in autumn, unless it is evident that the whole of it is not only brown, but dead. It is the only Irid in which the flowering stem throws out fresh flowering branches for several succeeding seasons instead of producing a fresh flowering stem each year. An extra tidy garden boy can deprive one of flowers of D. iridioides for a year or two if his zeal for neatness is allowed to outstrip his knowledge. E. A. BOWLES.

Waltham Cross.

Armchair Gardening

JANUARY and February are such depressing months from many points of view that most of us are glad of any crumbs of comfort that come our way. New Year good resolutions (amongst which doubtless was one to be more economical in the garden) are already "sicklied o'er with pale thought," and the tax collector, with his Schedule A, is not the guest we like to come a-wassailing to our door. So it is with a feeling of "Begone, dull care," we draw up to the fire, surrounded with the attractive and seductive catalogues that helped swell the postman's Christmas load, and, pencil in hand, plan out all we are going to grow during the coming year. And here I join issue with Major Chappell in GARDENING ILLUSTRATED of December 15th *re* misleading descriptions of colours in various catalogues. Who has not suffered from the annoyance of having their colour-scheme wrecked through trusting to the compiler's of the catalogue ideas of colour values?

Gardeners and nurserymen are the most truly conservative of beings, and so I take it that these catalogues are still written and compiled by men, but I cannot help thinking that it would be vastly to their benefit if they followed the lead of all other professions and sought the aid of women, who are so much more used to all the delicate nuances of colour. Indeed, as I often ponder in my visits to various nurseries, what opportunities have been missed and what a difference a trained and educated woman's touch would have made in the picture.

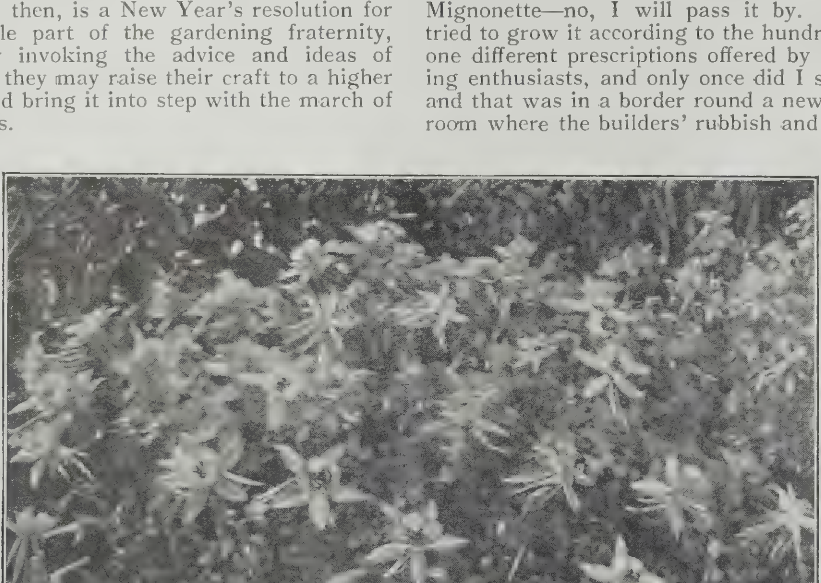
"The little more, and how much it is;
The little less, and what worlds away."

Here, then, is a New Year's resolution for the male part of the gardening fraternity, that by invoking the advice and ideas of women they may raise their craft to a higher level and bring it into step with the march of progress.

Now, my catalogue opens at Antirrhinums with three lovely spikes in salmon, pink, and cerise. So far so good, but last year's failure still rankles in my mind. I wanted a bed of glowing carmine, and ordered a packet of seed answering to that shade. Every seed germinated, and the last week in May we pricked out over 300 sturdy plants, but instead of my rich carmine came forth a dull claret-hued flower like a wine stain on a white table-cloth! So this year I shall stick to Nelrose, always reliable in its deep satiny-pink like an old La France Rose.

Bonfire is another shade to be relied on, deep apricot and orange, like the last rays of the setting sun, and Gay Gordon has somewhat the same effect, only in much deeper tones. A gorgeous-coloured plate of Calceolarias, with fat blobs of flowers like blotched balloons, makes one wish that they could be grown in the open instead of the common or garden yellow variety; but in this world it is always the unattainable that beckons, so we pass on to Clarkia elegans Salmon Queen, having been proved by experience the best variety, charming for vases and very lasting. And a packet of Cineraria maritima will make a delightful silvery setting for it, and one that will go on and on, long after the Clarkia has faded into nothingness.

Tall Antirrhinums are indispensable
forming bold groups, but should not
used for ordinary bedding



The long-spurred Columbine thrives in a semi-shaded position

The cook will welcome a sowing of the Ice plant (Mesembryanthemum crystallinum), for its cool, dew-spangled leaves make an uncommon setting on which to serve the lordly salmon or the blushing lobster. The word Lantana brings to mind that old-world plant with its prim heads of flower and its unpleasant smell, and I resolve to get a few plants in May to bed out. But as to Mignonette—no, I will pass it by. I have tried to grow it according to the hundred-and-one different prescriptions offered by gardening enthusiasts, and only once did I succeed, and that was in a border round a newly built room where the builders' rubbish and mortar
was to its liking, but when I tried a si
mixture for it elsewhere the result
failure. Mignonette is as fickle as For
Godetias are very accommodating; they
fer a moist summer, but put up with
one as long as they have plenty of
Double rose and double mauve are two

SOW AND PLANT IN SPRING AND BE REWARDED WITH SUMMER FLOWERS

1. Tobacco flowers (Nicotiana sylvestris), with perennial Campanulas and Phloxes.
2. Bold group of double flowered pink Hollyhocks.
3. Verbascum, on the outskirts of woodland.
4. Lavatera Olbia, one of the most lovely of all pink Mallows.
5. A good white Rocket Candytuft, Iberis Giant Snowflake.
6. Devil-in-a-bush or Love-in-a-mist, Nigella damascena.
7. A good background of double flowered Hollyhocks, with Hydrangea paniculata in the foreground.
8. Godetia, double rose.

lavender; Hero, a good, rich cerise; and Hawlmark Pink.

My method is to line some seed-boxes with rotten turf, covering with a mixture of leaf-mould, grit, and soil, then dibbling each seed in at a distance of 2 inches apart. The boxes are placed under shelter of the house, facing south-west, protected from mice by raising them on flower-pots and covering with wire netting. In about three weeks' time the most precocious will poke through, and in April they will be planted out in a piece of ground that has been well trenched with old lawn-mowings. Of course, most geese are swans to their owners, but I rather fancy the results must be pleasing to others as well, for from June to the end of September I am able to keep many friends well supplied and to satisfy my own wants. The only drawback is the amount of time one must spend in keeping the flowers cut to prevent seeding, but has not every pleasure its aftermath, and does not the realisation of that fact help us to view life through rose-coloured spectacles rather than the smoked glasses of Philistinism?

E. D.

Antirrhinums for bedding

ANTIRRHINUMS are amongst our most useful and showy summer-bedding plants and have attained a wonderful popularity in recent years. Although perennial in habit, they are best treated as annuals for bedding purposes, and few subjects lend themselves so admirably to the production of gorgeous colour effects as our modern varieties of Antirrhinum. There are tall, intermediate, and dwarf forms, each including a wide variation of colour, and in large beds or wide borders a wonderful effect can be produced by a combination of the three types. Seeds of many distinct colour forms are listed in the leading catalogues, and the plants may be relied on to come fairly true to colour.

To raise the plants necessary for the summer display seeds should be sown during early February in light, sandy soil, and placed in a moderately warm house. It is preferable to use small, shallow boxes, and thin sowing should be practised to ensure sturdy growth from the commencement. So soon as germination has taken place the boxes should be placed in a light, airy position, and when large enough to handle they should be pricked off into larger boxes. They may be grown on under moderately warm conditions till the beginning of April, when they may be planted out in a cold frame and finally transferred to their flowering positions so soon as the sites are prepared for them. Antirrhinums have the advantage over more tender bedding plants, that they can be planted in their permanent positions earlier, and the few weeks in a cold frame prepares them for full exposure, so that they may be planted out immediately after spring-flowering subjects are removed.

Antirrhinums succeed well on all well-drained soils and few plants resist drought so well when well established. If due attention is given to the removal of seed-pods as they appear a good display of flower can be maintained till the autumn. The dwarf and intermediate forms support themselves without staking, but it is necessary to give the tall forms some support, as, under good conditions of cultivation, they frequently reach a height of 3 feet or 4 feet.

Apart from their value as summer-bedding plants Antirrhinums may also be us
produce a wealth of colour in the s
especially on light, friable soils. Fo
purpose seed may be sown in July, p
off, and grown on outside till the au
and transferred to their permanent pos
sufficiently early to enable them to b
well established before winter sets in.
perfectly hardy they withstand the w

Planting Delphiniums

Amongst hardy-flowering plants fe
more conspicuous in the borders during
season of blooming than are Delphi
Probably because of the tall habits of
of them, some people think that for a
rately-sized garden they are too ungain
rather out of place, but those best acqu
with Delphiniums are aware that alt
as tall border plants they are better k
there are not a few varieties noted fo
compact growth, as well as for their b
ful blossoms. The flowering spikes a
ful for the decoration of vases, and last
time, if cut when the blooms are just e
ing; in fact, it has been remarked th
spikes remain in good condition longe
those on the plants. One argument tha
be reasonably advanced as to why De
iums should find a place in every g
where hardy flowering plants are appre
is owing to their hardiness and to th
that almost any deep soil suits them
vided that now and again they are n
gotten in the matter of manure, or on
when the time comes to divide the c

Phlox Drummondi and yellow-flowered Antirrhinums e of the causes why some fail with these rming plants is permitting them to go or years without any attempt being made ivide them, the result being that instead trong, healthy spikes, and, consequently, blooms, the clumps get into a weak con- on, owing to a conglomerated mass of and spindly shoots. It is only fair to that a clump carrying five or six spikes o be preferred to one with three times number, as with the latter it is almost ossible for the centre spike to get that t and nutriment so necessary if strong ering spikes are desired. It is therefore with clumps carrying a large number of ots to go over them early in the season cut the weakest away, tying up those are left to stakes, placing one to each ot of the tall varieties. If staking is left l late in the season, the stakes are likely e conspicuous, whereas, done early, the ge hides the supports, and the risk o age from rough winds is reduced.

elphiniums may be raised from seed, or may be increased by root division, the er plan being the one oftenest adopted, smuch, as a rule, not many plants are led in a garden. Clumps should be split n autumn, or early spring, and the ground re it is intended to plant them should be and deeply dug, some rotted manure g incorporated with the soil. It has to said of these plants, too, that although flowering season cannot be said to be a g one, they contribute much beauty to a den. As town and suburban garden nts they are worthy of more notice being en them.

Madonna Lilies, bush Roses, and Delphiniums in an old-world garden

ilium candidum, black-stemmed variety

ILIES may be roughly divided into two classes—those which one can grow in ordinary garden soil without much fuss trouble and those which require special s and treatments. Among the former, of the best of all is the old Madonna v. Lilium candidum, which is such a de- ntful feature in numerous cottage gardens, this beautiful plant is not always easy to w. It is subject to a disease of the leaf, l there are some soils in which it will not w. It seems happiest in a limy or chalky loam, and where it is happy it is a plant to use extensively. In recent years, a superior form of L. candidum has come to the fore, namely, the black stemmed variety, L. candidum variety peregrinum. This has the advantage of starting into growth a little later than the common form, and so often escapes late frosts which injure the type. The stems are very dark coloured, and the plant is, on the whole, more vigorous and I think healthier in constitution, or rather is less subject to the Lily disease. This question of stronger constitution is, I must confess, only a personal belief which I have arrived at after growing the two side by side. It would be interesting to have the views of other Lily growers on this point, and to learn if they find the black stemmed form more disease resistant than the type.

CLARENCE ELLIOTT.

Gypsophilas: their place in the garden

Both perennial and annual forms of Gypsophilas have long since established their reputation as useful for supplying quantities of blossoms suitable for employing as adjuncts to other flowers. Of the hardy perennial sorts the well-known paniculata and its double form have received a worthy addition in Bristol Fairy, a double variety twice the size of the older paniculata fl.-plena. Those, too, of a trailing or procumbent habit, like repens and cerastoides, have their use in certain positions in the rock garden. As now is the time when plants may be moved to fresh quarters readers are reminded of the fact that they are lime-lovers, and should the soil be deficient in this it should be made up in some form as, for instance, mortar-rubble, a spadeful or two being dug in the hole when getting out space for the clumps. They should be planted in a sunny position, and if the soil is heavy or inclined to be water-logged proper drainage must be provided. Annual forms of Gypsophilas can be sown out of doors in April, and it is well to follow with a further sowing a week or two later. Any light soil will meet their requirements, but a sunny place in the garden is essential. Present-day sorts embrace white, pink, and crimson. Broadcasting the seed in a bed or rows is the general practice in many places, as the annuals do not take kindly to transplanting. Few things of a light character amongst flowers have risen into favour more readily than have these simple blossoms, and there is scarcely a garden where they may not be grown.

MIDLANDER.

Gloxinias for early flowering

If young plants were kept growing all through the winter (an excellent plan), they should now be moved into their flowering pots. Fine plants may be grown in 6-inch pots, but if they are big and strong the 7-inch size is better. Use the best procurable fibrous loam and good leaf-mould, in equal proportions, with enough coarse sand to ensure porosity. The addition of a 6-inch potful of bonemeal and a 5½-inch potful of Thomson's Plant Manure to each barrowload of compost will make it almost perfect for the purpose.

Starting old bulbs

Failing a stock of young Gloxinia plants, some of the best of the old dormant bulbs should now be boxed, or potted, in leaf-mould and sand, and set in a warm house, where they will soon start into growth.

REMINDERS FOR THE WEEK

Southern and Midland

Early Peaches

Houses containing these may now be closed and some heat permitted, but a rush from a low temperature to a high one by means of fire heat must be avoided. A gentle circulation of warmth through the pipes which maintains such houses at 45 degs. to 50 degs. will be ample for the first fortnight, following which a rise of 5 degs. weekly will do no harm until the night temperature has reached 60 degs. to 65 degs., care being taken to see that vaporising troughs are filled each day. Little or no ventilation will be required until the trees are in bloom, and even then air must be admitted with extreme care at this early date.

The second vinery

This may also be started now. The same conditions as advised for Peaches will apply here also, with the exception that on very favourable sunny days the rods may be lightly syringed over immediately after 2 p.m. With the starting of these houses, valuable space becomes available for a variety of plants which it is necessary to bring forward, such as Strawberries, bedding plants which will shortly be required to provide cuttings, Cannas, and many flowering shrubs and bulbs, which respond gradually and very kindly to the gentle intermediate warmth to which they are introduced.

Annuals in pots

Such annuals as Mignonette, Schizanthus, Clarkias, Rhodanthæ and similar subjects which were sown in autumn should be grown as cool as possible, a temperature of 45 degs. to 50 degs. being ample at this season. Light and air being of the utmost importance, a position as near the glass as possible should be chosen for the plants and air given freely—but with discretion—whenever conditions are favourable; always air on the sheltered side of the house. Water only when the plants are absolutely in need of it—this will be proved by tapping the spot with a small stick, or preferably one's knuckles—and apply a light stimulant once every ten days.

Plants in bloom

Cyclamens, Primulas, Cinerarias, Freesias and Begonias should be given clear water only during their period of bloom. A little air admitted both night and day will prove beneficial and maintain the flowers in a fresh condition over a longer season.

Seed sowing

The following seeds may be sown now in a house in which the temperature is maintained at 60 degs. by night: Perpetual flowering and Border Carnations, Gloxinias, Cyclamen, Salvia splendens and S. patens, Poinsettias, Eucalyptus, Grevilleas, Begonias, Heliotropes and Achimenes. Shallow pots or pans should be used; they must be filled with fine sandy soil and be well drained. Some growers do not cover the seeds, but I prefer to use the lightest possible covering of fine soil. The receptacles should then be stood in a favoured position in the house and near the glass, a sheet of the latter being laid over each pan to prevent evaporation until germination has taken place, when it must be either raised or removed altogether. Should strong sunshine prevail, a little shading will prove advantageous during the brightest hours; damping of the seedlings must be guarded against.

Potatoes in pots and heated frames

Sprouted tubers may now be planted either in pots or frames. If the former are used they should be of 8-inch size, well drained and filled about half full with good turfy loam and leaf mould in equal parts. Two sets should be planted in each pot after having been disbudded of all but the strongest shoot, enough of the compost being added to cover the sets. For frames the same preparation of the tubers applies. The distance between the rows should be 16 inches, and between the tubers 12 inches, the surface of the border being at least 15 inches from the glass. May Queen, Midlothian Early and Webb's First Crop are excellent varieties for this purpose.

Asparagus

Lift strong crowns, grown for the purpose, and place them in the forcing house, where a temperature of from 60 degs. to 65 degs. is maintained, and whether such house contains a made up hotbed or not, the border should consist of the following compost: Two parts light loam, one part old mushroom bed manure and one part leaf mould thoroughly mixed. Place about 4 inches of this over the area to be used and lay the roots evenly over the surface, covering them with 3 inches of the same compost and finish off with a soaking of tepid water.

Planting trees, shrubs, and hedges

Most trees and shrubs may be planted whenever the soil is in working condition. It is necessary, however, to have the ground thoroughly prepared beforehand, and most things derive considerable benefit if a little leaf mould and sand is shaken over their roots at planting time; this is most noticeable among Rhododendrons and Azaleas, Kalmias, etc., the roots of which greedily consume the leaf mould. Positions for hedges should be trenched 3 feet deep, and the same width. If this were more frequently done we should not meet with so many disappointments. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Digging and trenching

Up to the moment of writing the ground is covered with snow and ice, especially ice, and outdoor gardening is entirely at a standstill, and has been for several weeks, with but small signs of any improvement. It will be necessary, therefore, to push on with all speed, digging and trenching as soon as weather conditions will permit. Meanwhile, if there is no snow, the wheeling of manure can be undertaken while the ground is frost-bound.

Garden rubbish heap

This is often a troublesome part of the establishment, especially where no attempt is made to keep the various kinds of rubbish separate. It is always well if this is done, the best method being to lay all such things as prunings, herbaceous stems, and all of a nature that will burn in one heap, all the softer material, like spent vegetable stems and leaves, annual weeds, and so forth, that will eventually rot down into vegetable mould in a second heap, while stones and other hard materials should be in a third heap.

Value of garden refuse

By periodically burning all the light rubbish of the first heap much va material may be had for mixing wit ting soils and for dressing herbaceous bo both in a manurial capacity, and fo discouraging of slugs and other vermi is also, if kept dry, invaluable for m with the soil when growing Carrots, and Parsnips. Then the contents o second heap, when well rotted, is but inferior to farmyard manure, and shou liberally applied to all vegetable qua when it will prove to be a great sa far less manure being required. Inde this material be well made (it shou turned and mixed about three times o the year), and given liberally to g ground, farmyard dung may, for a ye two be dispensed with for the ma of vegetable crops, any little deficienc ing made up for by slight dressin some good artificial manure.

Early Broad Beans

Although there is no great deman the humble Bean in some establishm it is still very useful at times, so it is to have a dish or two ready as ear possible. A row or two on a sunny should, therefore, be got in now, whe the soil gets into a workable conc Seville Longpod is one of the best for sowing, being very hardy and a good per.

Spinach

The old method of sowing Spinach tween rows of Peas is excellent, and is economical of space. It is also a good to put in a sowing of this valuable able every time Peas are sown, for b ing so an unbroken succession is tained, and the Peas in no way suffer.

Tomatoes

If not yet done the main batch of should now be sown and set in a tem ture of 60 degs. to 65 degs. Earlier ings should be picked off as soo sufficiently large enough to handle; use 2-inch pots, or boxes, and fresh, but n rich, light compost. Shade for a wee have the little plants as near the roof as possible to keep them sturdy.

Schizanthus

This, our finest annual pot plant, i growing in small pots, should very s be moved into the flowering sizes, usin fresh compost, but giving very little m of any kind, as the plants, if over-fed, leaves and stems and produce few fl Splendid little specimens for decorativ poses may be grown in 5-inch or pots. Cool treatment is best, but frost not touch them.

Border Chrysanthemums

It is advisable, as a rule, to mov pots or boxes of old roots from the where they have been wintering into a with a little warmth so as to encoura sending up of suitable cuttings, thes ing taken off when about 3 inches and inserted in boxes of light sandy Keep rather close and shade from th until rooted.

Seeds to sow now

There is still time to sow Pansy, East Lothian Stock, Verbena, and Holl to bloom this year, but no more time be lost in having this done. Good r may also still be had if a good, warmth of 70 degs. to 75 degs. ca maintained, by sowing at once Be Gloxinia, and Streptocarpus. C. BL

Preston House Gardens, Linlithgow.

Lachenalia pendula

T this time of the year things in the
floral world are naturally at a subdued
stage, and less space is occupied at the
nightly exhibitions at Vincent Square than
be required a little later on; but even
his period there is always something on
v which is well worth while, and occa-
ally the "something" is especially
resting because of its heroic appearance
such a discouraging season—as, for
ance:—At the exhibition of January 15th,
ssrs Barr and Sons, Ltd., had a character-
ally January display of dainty pioneer
gs—the advance guard of the season—
alongside them was a patch of strong
uring, which promptly caught the eye
arrested attention as being one of the
things which give a welcome dash of
d solid red at a time when strong colour-
is not prominent among the "flowers in
son." This arresting group consisted of
e three dozen spikes of Lachenalia
dula—a plant not nearly so well known
it deserves to be, seeing it is of dis-
tly easy culture, and is one member of
Lachenalia family which can be had in
bloom at Christmas (or earlier if re-
ed) when its cheery colour is especially
come. Most of the Lachenalias come
ng rather later, being generally at their
about from the middle of February to
end of March; we hope to write a little
e fully about them presently with details
heir culture and simple requirements, but
the moment the species "Pendula" is
outstanding representative of the family
ch claims our attention.

he group shown was of cut spikes, with
nossy setting, but unfortunately had to
exhibited without foliage, and, attractive
re the blooms alone, they are delightfully
e so as grown, say, half a dozen in a
with their natural accompaniment of
ad pointed leaves.

Ve suggest that our readers make a note
this bonny plant—an easily grown cold
se bulb—for adding to their floral
orations for next Christmas.

Impatiens

re not these showy members of the
aniaceæ ever to be seen in more than a
y few gardens? It is strange how some
nts are overlooked, even in places where
re is every convenience and scope for
wing them.

mpatiens are tender perennials, and need
tove or warm greenhouse to grow them
l.

he one best known to gardening is pro-
ly I. Sultani, and one sometimes comes
oss plants of this original, scarlet-flowered
cies in some of the old-established gardens
and down the country. But hybrids of
s type are now both numerous and beauti-
, and some delightful shades of pink now
ainable should find favour with flower
ers, especially feminine ones.

mpatiens Sultani is a native of Zanzibar,
l figures in Bot. Mag. t. 6643.

Another popular type is the scarlet, or
haps one should say orange-scarlet, I.
lstii, of East Africa. It, too, has nume-
s hybrid forms at the present time, and
y make a gallant show as pot plants for
conservatory, and flower over a very
g period.

he cultural requirements of the above are
by any means extravagant, moderate
rmth being the dominating factor. Seed
y be sown at almost any time, and any
d open potting material will suit their
ting requirements. It would, perhaps, be
well to add a word of warning in regard to
ughts. The stems and foliage of Impatiens are very succulent, almost transparent in some cases, and cold draughts, more than anything, seem to be fatal to them. The leaves will just drop off without warning, and the whole plant very soon is lost through the action of a cold draught.

One or two other Impatiens, not of so great a value for decorative purposes, and, consequently, but very little known, are I. auricoma, a yellow-flowered species from the Comoro Isles; and I. Marianiæ, from Assam, a species with silvery variegated foliage, and altogether a very elegant plant. I. Hawkeri is a robust grower, having large bright red flowers. This Impatiens is showy, but very coarse in appearance, and not likely to be a favourite with anyone.

H. W. Stenning.

Lachenalia pendula var. Guernsey

Exacum macranthum
A Gentian-blue greenhouse plant

There are some plants which will never become common, not because they are not worth growing, but for the simple reason that they are "miffy" and will only succeed when their requirements are really understood.

Exacum zeylanicum Var. macranthum has been in cultivation for many years, and although it produces abundance of flowers of great beauty, it still remains an uncommon plant. To those who are unfamiliar with this plant a brief description may induce them to purchase a packet of seeds and try their luck. As a pot plant it is ideal because it is compact and grows to about 18 inches in height, and produces great quantities of large Gentian-blue flowers which are rendered more conspicuous by the golden anthers, which stand out in bold relief against the dark blue petals. The flowers are produced on plants which have been raised from seeds sown the previous spring so that a start should soon be made now if flowers are required for next year. The seeds, which are obtainable from any of the leading seedsmen, should be sown in pots filled with sandy peat, and lightly covered with silver sand. These plants resent root disturbance, and no doubt most failures with them can be attributed to careless pricking off. To obviate this I recommend sowing several seeds in a 3-inch pot, and when the most vigorous can be determined, to reduce the number to three, and when the pot becomes filled with roots transfer the lot bodily into a 5-inch, in which they may be left to flower. This non-disturbance of the root-system is, I think, the secret of success, together with careful watering and a suitable compost.

The ideal mixture is three parts fibrous peat, one part loam, and one part leaf-soil, to which a small amount of sand and crushed charcoal have been added to assist in keeping the soil sweet. To induce the formation of a bushy habit it is necessary to pinch out the leading shoot when it is about 3 inches high, and the resulting side shoots should be similarly treated. The plants are well rooted in their final pots by the autumn, and careful watering is practised during the winter months, there is no reason why a good batch of plants should not be obtained to flower profusely the following summer.

G. F. Gardiner.

VEGETABLES

Control measures of Wart Disease in Potatoes

WART DISEASE has now gained world-wide notoriety. The loss it may occasion is equal to that of Blight, but there is an added evil with the Wart Disease fungus (Synchytrium endobioticum) which is not found with Blight, namely, that it contaminates the soil and renders it unsuitable for the future production of any Potatoes other than the immune varieties. This is due to the presence in infected soil of long-lived spore cases or sporangia which are particularly resistant to the action of fungicides. The disease is prevalent only in certain parts of the country, and the importance of using every means to prevent its further spread cannot be emphasised too strongly.

Description of affected plants.—The tubers are the parts which are chiefly concerned. In the early stages of the disease young warts may easily be seen in the eyes, though the time of their appearance varies with the variety of Potato. They increase in size and subsequently become irregular excrescences, which often run together, forming large masses. In certain varieties (*e.g.*, Arran Chief) all resemblance to a normal tuber may be lost, the entire tuber being transformed into a coralloid mass. The warts are at first white, but if exposed to light through not being covered with soil they may become green. As they become old they begin to turn black and finally form a putrid mass, from which a dark brown liquid exudes.

Control measures.—The only method at present known of raising clean crops on contaminated land is by restricting cultivation to immune varieties—*i.e.*, those which absolutely resist the attacks of the fungus. A selection of the best of these varieties is given below.

Many experiments have been made both in

this country and elsewhere with soil fungicides of various kinds, but with little or no success.

Until recently Wart Disease was only known to attack the Potato itself, but it has now been found to be capable of infecting also the Woody Nightshade (Solanum Dulcamara), the Black Nightshade (S. nigrum), the Henbane (Hyoscyamus niger), and certain varieties of Tomatoes, though apparently only to a very small extent. This fact should be borne in mind when attempts are being made to clear the ground of the Wart Disease fungus, and any specimens of these three weeds should be uprooted and burned. Tomatoes also should not be planted.

IMMUNE VARIETIES.—The trials carried out at Ormskirk under the auspices of the Ministry of Agriculture and Fisheries have demonstrated beyond all doubt the immunity of certain varieties. Disappointment in the past as to immune varieties has been due (*a*) to wrongly named seed, (*b*) to the presence of "rogues," or (*c*) to the use of varieties which, though formerly supposed to be immune, had not been properly tested.

Statements have been made that varieties which are immune from Wart Disease lose that character if they become attacked by one or other of the so-called virus diseases (Leaf-Roll, Mosaic, etc.), but experiments have proved that this is not the case.

The following is a selection of some of the best immune varieties recommended by the Ministry for planting in contaminated land on most classes of soil :—

Young Cauliflower plants in winter

There are two ways of obtaining early Cauliflowers—those nice, compact balls which are so much appreciated when the larger and somewhat coarser ones of the Broccolis are all used. The first way is that of sowing seeds in August and September, and wintering the resultant plants in cold frames or under some temporary covering; the second one is that of sowing seeds under glass in January and treating the resultant plants as half-hardy ones until the end of March.

I am now, however, only making reference to the plants from autumn sowings. They require very careful treatment or they will be spoiled. By careful treatment I do not mean, specially, coddling in frames. This would be harmful. Protection must only be afforded during frosty weather. When very severe frosts prevail the plants will, no doubt, be slightly frozen, notwithstanding the care taken to protect them. When this happens they must not be exposed to the air and sunshine until the frost is gone and the leaves are completely thawed.

The night prior to the uncovering of the frame raise the lights and syringe the foliage thoroughly with cold water. Then close the frame again. The following morning remove the mats, straw, or other material, and admit some light, also raise the glass-lights a little. Close the frame again at night. The second day remove the remaining covering material entirely and admit air freely. During milder weather expose the plants fully every day, but protect with the glass lights at night. The plants should be kept clean and the surface soil be loosened occasionally with a pointed stick. G. G.

Hants.

Lettuce, Radishes, and frame-grown Potatoes

The work of growing early crops of salads and vegetables is very interesting. To obtain the three named above there must be some forcing of growth, but not by means of fire heat.

They should be grown in deep frames or on hotbeds with frames placed on the latter. In suburban gardens, where tree leaves and litter cannot be obtained, the attempt to raise these crops should not be undertaken before the first week in February, as bottom heat will not be available. But, in the meantime, seed tubers can be brought on by placing them half-buried in soil in boxes in a greenhouse or similar structure. Where hotbeds are built up in deep frames use litter and tree leaves in almost equal proportions. Damp the material a little if it is very dry, but have it on the dry rather than the wet side, as the heat engendered in the former case will be steadier and more lasting. A suitable hotbed will be one about 2 feet deep where the soil has pressed it down. The heat in a bed of this kind will last nearly two months, and that is all that is required.

When engaged in building up the hotbed shake out the material loosely, then it will settle down evenly and firmly. Potatoes will grow nicely in pure, well-rotted leaf-soil, but I prefer to use good loam and leaf-soil in equal proportions with a small quantity of rotted manure if the latter is available. The depth of the soil should be 1 foot. Earthing-up will not be done. Plant the tubers 4 inches deep, leave a level surface, and sow seeds of Radishes and Lettuces very thinly and evenly on the surface, simply raking them in.

Place the glass-lights in position and do not remove them before the first seedlings appear, then admit a little air at the top of the frame; at the same time the dangerous steam arising from the hotbed will escape. Both day and night a small opening should be provided, otherwise the seedlings may succumb to the very moist atmosphere. Light in these frames can be admitted because the heat arising from the hotbed is sufficient to exclude slight frosts, but on very cold nights it is advisable to cover with mats in the depth of winter.

Early-maturing varieties should be grown, such as Tom Thumb Lettuce, Wood's Early
Frame, and French Breakfast Radishe
Eclipse and Midlothian Early Potatoes.
last-named is a yellow-fleshed variety,
good quality. The Lettuce plants sho
drawn while in a young state, and the
they and the Radishes will be cleared
the bed by the time the Potatoes are
for use. G.

Hants.

FRUIT GARDEN

Protecting the Apricot

THE Apricot being naturally dispo
expand its blossoms in advance
other hardy fruits, the trees should,
out further delay, *i.e.*, if the matter h
already had attention, be pruned, tr
nailed, and tied, as the case may be, s
protection can be afforded directly
comes necessary to do so.

With regard to this question, I ha
ways found it incumbent to protect the
cot in an earlier stage of bud develo
than is the case with the Peach and
tarine, for instance. In the last-men
instance protection can be withheld unti
time that the flower buds are on the
of opening, but with the Apricot it sho
in readiness to be applied directly the
begin to swell. They are then, if le
posed to the action of severe frost, ver
ceptible to injury. Some years ago
quite three-fourths of the fruit buds
outright by a hard frost, which wa
means of rendering the crop a very shor
After such an experience a point was a
made to have everything ready, so tha
tection could, as soon as occasion requi
be applied at once.

The form of protection used consist
"Frigi Domo" blinds, which is the best
material for warding off frost, and will,
reasonable care, last in good conditio
several seasons. Boards 11 inches lo
inches wide, and 1 inch thick were
immediately beneath the wall copings to
rain water clear of the trees. On their
edges pulleys were screwed, for the pu
of raising and lowering the blinds o
high walls, and hooks on which to su
them on the walls of lesser height. To
the blinds from chafing the trees, poles
let into the border 3 feet from the b
the wall and about 5 feet apart.
stakes were driven in by the side of the
in such a way as to form a V-shaped
to hold and keep the blinds off the g
during the day and when not in use.

Other means of affording protection
the employment of garden nets. Th
½-inch mesh are the best, and they sho
suspended from the edge of the
boards two or three thick, and allow
just reach the ground. Poles or stak
required to keep the nets off the trees
they should also be pegged down t
ground. I have occasionally secured
crops by the use of nets as a protective
but it is not so reliable a method of
ing protection from frost as when "
Domo" blinds are used.

The working of suitable pieces of
or Yew among the branches of the
secures a certain amount of protecti
the buds and blossoms, but they ha
disadvantage of weakening growth a
as buds and blooms owing to the exc
of a certain degree of sunlight and ai

After all, the Apricot is such a lu
fruit—no imported example that I hav
tasted being comparable with a well-
and fully-ripened specimen produced i
country—that when it succeeds the c
blinds, poles, boards, etc., ought not
grudged in order that adequate prot
may be given the trees. A.

Answers to Queries

eries—*Queries and answers are inserted in* ENING ILLUSTRATED *free of charge if corre- dents follow these rules: All communications ld be clearly written on one side of the paper , and addressed to the* EDITOR *of* GARDENING STRATED, *Bouverie House, Fleet Street, London, 4. Letters on business should be sent to the* ISHER. *The name and address of the sender required in addition to any designation he desire to be used in the paper. When more one query is sent, each should be on a rate piece of paper; the name and address g added to each. As* GARDENING ILLUSTRATED *to be sent to press some days in advance of , queries cannot always be replied to in the immediately following their receipt. We do reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

FLOWER GARDEN

ing annuals in woodland

is my wish to sow various seeds—Candy- Primulas, Foxgloves, and Matthiola rnis—in a wood where grass has not n; wood is fairly light. Must the nd be forked up, or would mixing the s with a lot of soil do the same? Also could I prevent birds from taking the s? When is the best time? Would I bloom this year? IN DOUBT.

here appears to be no reason why seeds e flowers mentioned should not succeed. e the soil firmly with a steel rake, mix seeds with three times their bulk of sand f finely-sifted dry soil, and sow thinly. revent birds from eating the seeds damp latter with red lead. Slugs would most y be troublesome to the seedlings, and, iscourage these, dress the ground, after ing, with wood-ashes. Foxgloves and pies are certain to give a good account of nselves. If you sow annuals in March or y in April they will all bloom during sum- and autumn. Foxgloves, of course, are nials. If seeds be sown at the time indi- d a few of the resulting plants may bloom he autumn months, but the bulk of them ld not flower until next season.]

volvulus in neglected rock garden

n Doubt).—It is a very heart-breaking to eradicate Convolvulus when that pest obtained a footing, and especially in a garden. But on no account must weed- r be used; it would kill everything else, it would leave the fleshy roots of the volvulus unharmed, although any wths above ground would be destroyed. the effects of cutting over the young wths of the Convolvulus at the ground- l once a fortnight. Continual cutting weakens the roots, and these ultimately if the work is persisted with. In a ery, of course, a hoe could not be used, an old, sharp knife will be found service- . Tackle the problem at once and do not discouraged if the result does not appear e at once satisfactory. Badly polluted und has very often been cleared of Con- ulus, Snakeweed, Bishopweed, Couch ss, and similar weeds by persistently pping off the growths for a season or two.

e Cornflower

rchard).—It is assumed, of course, that Cornflower referred to is one of the ual varieties, and King of the Blues has ery likely name. An extensive selection be found in Messrs. Sutton's compre- sive catalogue. Sow in March or early il and thin severely.

conopsis Baileyi

. C,).—This is undoubtedly a variable ling from Tibet, and can only be regarded a geographical form of M. betonicifolia note on page 69). In its best form it unquestionably one of the most lovely hts of recent introduction.

Iris Pavonia

I have a batch of Iris Pavonia (imported) in pans of loam, leaf soil, silver sand, and a little four-year-old cowdung, rooted in cold frame and now in cool house. They do not seem happy, the grass very weak, and move very slowly, although one pan of offsets from home-grown bulbs that failed to flower last season grow well. Will you please advise me how to flower this Iris and give me the name of a good modern book on Irises in general? C. A. C.

[It is difficult to judge the cause of the plants not seeming happy without seeing them. If they are being grown from imported tubers it is quite possible that they arrived in a dried up condition and require time to acclimatise themselves. This Iris is a native of South Africa, where the seasons are just the reverse of those in the northern hemisphere. This species succeeds best when grown in peat, and we think the addition of cow manure to loam, even if of light character, was rather a doubtful experiment. As they do not look happy, we should have no hesitation in transplanting them into peat-soil and placing them in a sunny position, just keeping them damp. There are two varieties of the Pavonia, and the one known as Major is far the better. It is possible that the weak foliage may be produced by the smaller variety. They should bloom in a warm position in a well-drained part of the rock garden outside, but should be given a covering of dry Heather through the winter, where it should remain till the cutting winds are over. The Peacock Iris is sometimes listed under the names of Moræa glaucopis, and also that of Vieusseuxia glaucopis. We would suggest placing some pieces of rock amongst the peat, which I. cristata and I. Persica both like. Another lovely species of the Moræa is Iridioides, which bears spikes of white flowers with dark blotches. The M. Iridioides Johnsonii has spikes of white flowers with orange blotches and flattened stigmas of a lavender tint. Both the last named require a cool house, and we have seen them grown with beautiful effect in a hanging basket, in which they bloomed year after year undisturbed. A useful book on the Iris family is "The Book of the Iris," by R. Irwin Lynch (well illustrated), published by John Lane. The writer was for many years curator of the Botanic Gardens, Cambridge. The so-called Iris Pavonia is excluded as it is classed as a Moræa. The book is an excellent one, with a chapter on the Oncocylus section by Rev. Henry Ewbank. See also Dictes spahtacea, page 71.]

GREENHOUSE

Plant for name

(G. L.).—The leaf enclosed is not that of a Cactus, but of one of the Sedums, almost certainly Sedum japonicum, although the specimen was rather withered. This makes a very useful plant for window cultivation, but, naturally, it succeeds better in a greenhouse—even in an entirely unheated greenhouse. When the plant attains to the flowering size it ought to bloom annually. Cuttings are easily struck in light, sandy soil, either with or without the aid of artificial heat, and any ordinary potting compost (three parts loam, one part leaf-mould, and a little sand) will meet their requirements. Possibly the other plants to which you refer as "Cactuses" are of a similar nature, and may be treated in a like manner. A scullery window is not the most promising place in which to grow plants.

TREES AND SHRUBS

Planting a hedge and wind screen

I want to plant a hedge about 45 yards long on ground 4 feet to 5 feet above road to form a wind and sight screen. Soil is good loam with sand, gradually turning heavier, till 2 feet or so down it is clay. Situation: Sheltered from north and east, but very exposed to west winds off the Bristol Channel 400 yards away, and fairly exposed to southwest and south, from which direction gales in the autumn whipped the foliage off Privets and American Pillar Roses.

(1) Do you consider Lonicera nitida will thrive and retain its leaves during winter?

(2) How many plants would be needed to form a thick hedge?

(3) Can you recommend anything better and cheaper? Height is not a great consideration so long as it will attain 3 feet to 4 feet fairly quickly. I shall be very much obliged by your replies to these queries in GARDENING ILLUSTRATED. My best thanks in anticipation. R. O. C.

Portishead.

[(1) Lonicera nitida, though cheap and a good grower, is not sturdy enough for a shelter hedge. It singes badly in the wind. It is useful as a dividing hedge inside a garden.

(2) Lonicera nitida plant 1 foot to 18 inches apart. Privet 1 foot apart in a double row, 1 foot between the rows.

(3) Privet is stronger and better than Lonicera nitida for shelter. The ground should be thoroughly well dug and prepared, the plants cut back at planting within 2 inches of the ground. March is a good time to plant. A second hedge of small Cupressus macrocarpa planted in May behind the Privet would give solid protection. It would pay to put hurdles in front of the Privet, which is the quickest-growing plant for the purpose. The outside of the hedge will singe in the wind, but inside it will be glossy and fresh. Privet is much cheaper.]

Dwarf trees

(In Doubt).—Some of the specialists in topiary and similar work might possibly have dwarf trees such as you desire. Try Messrs. Cutbush, Highgate Nurseries, N., or Baggesens, Hardy Plant Nurseries, Pembury, Kent. You may, however, find it interesting to experiment with Acorns, Beechmast, and seeds of some of the Pines. These, sown in 2-inch pots, readily germinate, and if kept in these pots and starved the seedlings grow into miniature trees. Seeds of the Locust Bean, so treated, produce elegant little trees. The real secret of dwarfing trees, which yet retain true proportions, is only thoroughly understood by those clever and painstaking gardeners, the Japanese.

Newly planted Larch trees

I should be much obliged if you could tell me whether it would be beneficial to mulch small, newly planted Larch where the soil is so shallow that a three-weeks' drought shrivels the growths, and what would be the best material to mulch with. LARCH.

[Mulching in the case of your Larch trees is clearly indicated. Not only would a good mulch be of present service, but it would add to the depth of your shallow soil. Do not, however, use manure, even if it be well rotted; good leaf-mould, and plenty of it, would be better. In addition, and during the searching winds of spring, it might be possible to afford the young trees a certain amount of shelter—even boughs of evergreens, such as Laurels, would be beneficial.]

Pruning shrubs

(Geo. Soper).—If you cut down your Solanum jasminoides it will not flower as freely as it will do if you will merely thin out the tangled growths. This is not easy, and demands much time and patience. Personally, we would cut it down in March, and take a little trouble to train the young shoots thinly and evenly. You can always cut away the weaker shoots and such as over-crowd their neighbours. Unfortunately, you do not mention the variety of your Buddleia, and different varieties require different treatment. B. globosa should be thinned out at the end of June, while B. variabilis, should have the wood of the previous year well cut back towards the end of March. If the mildew is the ordinary Gooseberry Mildew, it may be checked, if not completely banished, by spraying the bushes in spring with Bordeaux Mixture, while should it be American Mildew, you must at once notify the local authority, and they will advise you how to treat it.

FRUIT

Sweet Chestnuts

Is it possible to obtain in this country a Sweet Chestnut of the very large variety (for baking purposes), similar to those sold in the streets, which, I believe, are Spanish?

E. Davis.

[Good Standards that would fruit quickly, about 10 ft. high, may be obtained from 5s. to 6s. each. This is the variety that is used for roasting, and if planted in good, rich ground soon produces fine, large nuts.]

The best Raspberries

(E. S. E.).—We strongly recommend the following, bearing in mind your heavy soil:—Superlative, Royal, Hornet, Baumforth's Seedling, and Herbert. Perpetual fruiting varieties:—Perpetuelle de Billiard, Ameloire de Congy, November Abundance, and Surprise d'Automne.

Damaged Apple tree

(Orchard).—If the branch has been broken off close to the butt of the tree, and if the damage has caused a hole in the trunk, the only remedy is to fill the aperture with well-sanded cement, one part cement to three parts of sand, with a layer of pure cement at the top to the depth of half an inch. But if the cavity is in the damaged branch saw the latter off close to the stem, smooth over the cut with a very sharp carpenter's chisel, and dress with Archangel tar.

Black Currants and Gooseberries

(Nicotiana).—As your soil is poor and porous, is was wrong to bury the manure so deeply, especially as neither Black Currants nor Gooseberries are deep rooters. The latter do not require very rich soil, but all the same, as you have yourself proved, they do not grow very well on really poor ground. You would require to apply a fair dressing of well-rotted manure to the part intended for the Gooseberries, and a much heavier amount of the same where the Currants are to be put in. (1) If you prepare the ground as advised above, you could move the four-year-old bushes you have to the new site, where they ought to grow away all right. Do this in February. (2) As a cooker, Whinhams Industry is hard to beat, while for preserving Red Warrington is excellent. Any variety if picked while still in a small state is good for bottling, but the old Green Gascoigne, even if left until nearly full grown, is one of the best for this purpose. (3) Boskoop Giant and Seabrooke's Black, are two of the best Black Currants, but there are none absolutely immune to "Big Bud." We might say that your soil is not well suited for the cultivation of this fruit, which demands rich, rather moist soil to do reall ywell. You could help matters a bit if you could plant these Currants in a rather shady place, but not under trees. Keep the ground between the bushes well mulched with manure, and in really dry weather afford them a thorough soaking of water at the roots once a week.]

Apple warts

Can you tell me what is the cause of my Cox's Orange Apple tree throwing out large pimply wart-like nobs. They do not appear high up on the branches, nor low down on the trunk.

A. G. F.

[The wart-like growths which you send for examination are aerial roots and will not cause you any serious trouble. Certain varieties of Apples produce aerial roots very freely on all types of soil; other varieties only produce these roots under certain soil conditions. Cox's Orange does not, as a rule, produce aerial roots under ideal soil condition, and it appears likely that your soil does not suit this variety as well as it might. Are you certain that the soil is well drained? because defective root action would encourage the production of aerial roots. When spraying your tree pay special attention to the area bearing aerial roots, because insect pests shelter in such places, and unless the spray fluids are well driven in to the crevices, spraying is very largely useless. When an Apple tree sets a large quantity of fruit the number of fruits should be reduced early in the season. All trusses which bear more than one fruit should be reduced so that only one fruit is carried. If the trusses are very close together some of them should be relieved of fruit altogether; aim at getting your fruits spaced out so that on an average there is one fruit for each 6 inches to 8 inches of growth. We should advise you not to be too drastic in the pruning of your trees in the effort to keep them to a set height. The natural height of an Apple is not much over 20 feet, but by pruning this height can be exceeded. The easiest way to limit the height of a tree is to prune lightly.]

VEGETABLES

Cultivating winter Lettuce

(W. Croad).—Towards the end of September seeds should be sown in cold frames for this purpose, and about every 10 days throughout October where, should it become necessary, protection can be given. Frames or pits which can be heated at will are excellent for growing Lettuces, but care in the regulation of heat will at all times be necessary. A warm, moist atmosphere and a little air whenever possible is desirable. Another plan is to make up beds of leaves and stable manure to supply the warmth, but whichever is used, the surface border should consist of good, rich loam to which has been added a little well-decayed manure or leaf-mould, and the surface of the border should not be more than 14 inches from the glass. When large enough to handle put out the plants at 10 inches apart in successional batches as the various sowings become available. Others may be planted out in cold frames for later supplies, as such succeed remarkably well without any heat whatever, but airing must be strictly attended to as the sun gains power. During spells of bad weather it may not be possible to uncover the early frames for several days at a time, in which case damp-
ing may occur, and this must be look
and removed. To follow the frame
batches of Hardy Winter White Cos,
Density, Trocadero, and Black-seeded
sown in September and planted out on
tered border during October will be
most satisfactory, and a sowing mad
warm house or frame in February will
plants to follow the varieties men
above. These will mature about W
tide.

MISCELLANEOUS

Lime sulphur

Your issue of January 12th, under
ing of "Spraying Fruit Trees," has s
the information I sought, but, excu
ignorance, I have never heard of lin
phur. Where can I get it diluted, an
quantity of it should I put in to, say,
ful (ordinary servants' pails) of abou
six gallons to the pail? Two pailfu
about all I shall require at a time, as
not any tank to hold 99 gallons of wa

A. G

[You can obtain concentrated lim
phur from any firm who deals in insec
and you will find particulars of such
advertising in our columns from time t
The lime sulphur bought in this c
trated form only requires the addit
water to make ready for use. To ma
a solution of approximately one in 10
three gallons of water and slowly add
of concentrated lime sulphur, stirri
the while. Wooden buckets or tubs a
ferable for mixing lime sulphur, and
ing machines made of copper shou
be used because the sulphides present
solution eat away the copper. If yo
only a very small quantity it need n
in an ordinary bucket long enough to
either bucket or sprayer. Well wash
utensils after use. If you have not
used your tar oil spray you should a
forthwith.]

LATE NOTE

Trial of new Roses

There is every reason to assume th
trial of new Roses by the National
Society will prove a great success.
2,000 plants have already been receiv
planted from British, American, and
tinental raisers. Mr. Courtney Pa
Secretary, is making the necessary a
ments for the trials, which will be
Haywards Heath, and only m
of the Society will be allowed to visit t
ground. Awards at the trials will b
distinct from any that are now given
National Rose Society.

By Appointment.

LAWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS' LAWN GUANO

(A Compound Fertilizer)

The safest dressing for turf. It feeds the turf over a long period and will not burn or discolour the grass. Lawn Guano quickly strengthens the roots and encourages a dense growth of fine grass. As used by important clubs and municipalities. Apply now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Prices, in Bags: 7 lbs., **3/-**; 14 lbs., **5/-**; 28 lbs., **9/-**; 56 lbs., **15/-** 1 cwt., **25/-**. Carriage paid.

FISONS' LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed, such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.
Prices, in Kegs: 14 lbs., **5/-**; 28 lbs., **9/-**; 56 lbs., **16/-**; 1 cwt., **27/6**. Carriage paid

FISONS' BASE FERTILIZER

should be incorporated with the soil before sowing grass seed. Specially prepared to promote strong root growth and give new grass a good start. Use 4 ozs. to the sq. yd. a few days before sowing the seed.
Prices, in Bags: 7 lbs., **3/-**; 14 lbs., **4/6**; 28 lbs., **7/6**; 56 lbs., **12/6**; 1 cwt., **20/**. Carriage paid.

FISONS' GRASS SEEDS

are the finest procurable, being specially tested before selection.
Special Mixture (for Bowling and Golf Greens, finest grasses only).
Prices, in Bags: 7 lbs., **15/6**; 14 lbs., **30/-**; 28 lbs., **58/-**; 56 lbs., **110/-**; 1 cwt., **210/-**. Carriage paid.

LORDINGTON HOUSE EMSWORTH
(Photograph by courtesy of Admiral Phipps Hornby)

A Lasting Surface!

This attractive drive was reconstructed with COLAS in April, 1926, and although a considerable amount of farm traffic, including heavy market and milk lorries, is carried, *no attention whatever was necessary for over two years.*
COLAS modernises Drives and Paths, and entirely eliminates the usual constant attention. COLAS arrives *ready to apply* and can be put down by anyone at any time of the year.

One drum containing 30 gallons, costing 40/-, delivered direct to destination within the Railway Company's free delivery area will cover approximately 100 sq. yds. of gravel drive or path. A considerable reduction is offered if two or more drums are ordered.
Write to Estates (K) Dept. for 24-page Booklet and Prices.

Spring Flowers

How we got our favourite varieties. Triumphs of cultivation

HE general lover of spring flowers, who is, after all, the average member of the community, is usually content to love blooms for themselves alone, and knows of their origin and development. It ot fail to add, however, to his or her est in the charming blooms that bring them the first promise of brighter days the long and dreary winter to know ething of what art and skill have conted to their present perfection.

om amongst the numerous early spring ers three stand out as the most popular in greatest demand, the Hyacinth, the odil, and the Tulip. The cinth, also called the nth, supreme amongst flowers of the spring, is a e of the Levant, where it rs abundantly, in form unlike our common Hare- It is no new favourite, ng been in cultivation to 1597, at which date rd records the existence six varieties which are ated as "particularly and novel." Rea, in , mentions several single double varieties as being English gardens, and ce (1754) describes upds of 50 single-flowered eties and nearly 100 le-flowered ones, a selecof the best from the catae . of two of the then rated Dutch growers. of the Dutch sort, called Reine de Femmes, a e white, is said to have uced from 32 to 36 in a e, and on its first appearto have sold at from 50 ers a bulb, while one led Overwinnaar, or ueror, a double blue, sold first for 100 guilders, ria Mundi for 500 lers, and Koning non for 600 guilders. ral varieties are at that mentioned as flowering lin water-glasses. Justice es that he himself raised al very valuable doublered kinds from seed.

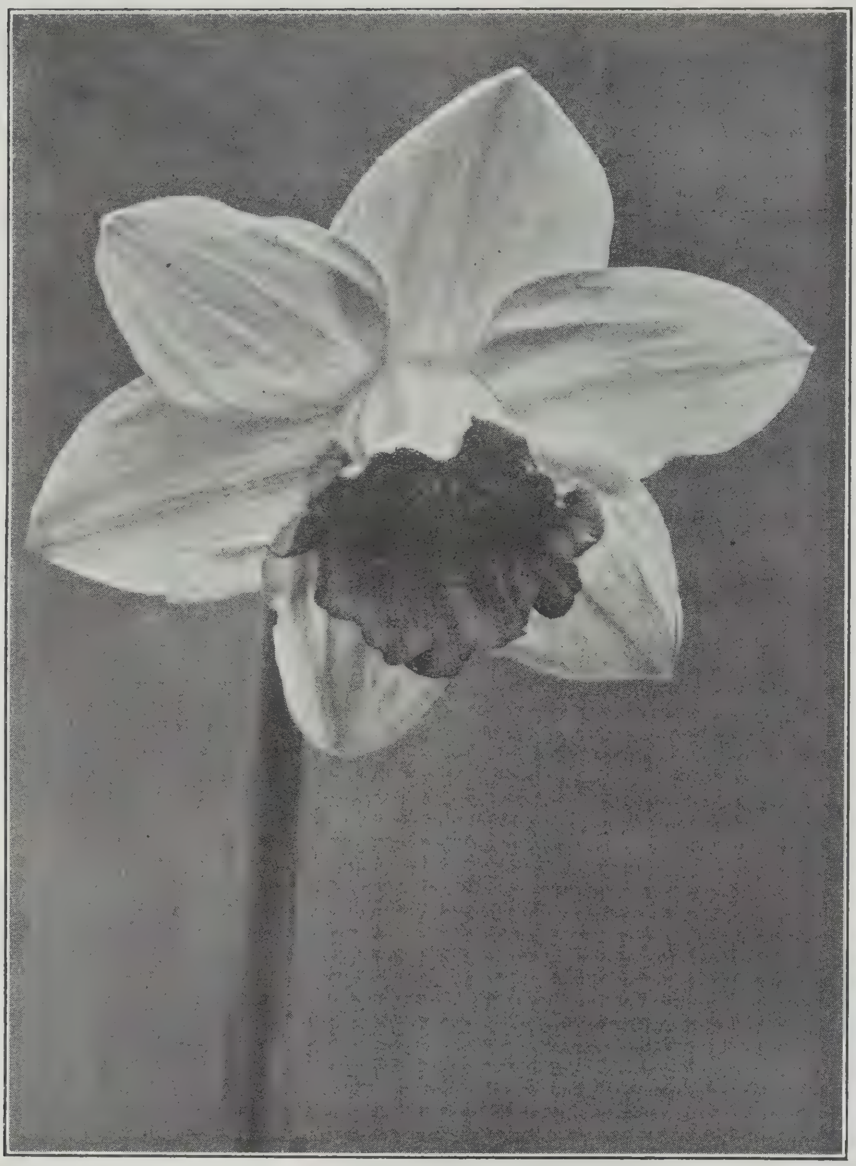
le original of the culti- Hyacinth is by comison an insignificant , bearing on a spike only w small, narrow-lobed, pale blue flowers. So great has been the improvement effected by the florist, chiefly the Dutch, that the modern product would scarcely be recognised as the descendant of the type referred to. The spikes are now long, dense, and composed of a large number of flowers. The spikes produced by strong bulbs not infrequently measure 6 inches or 7 inches in length and from 7 inches to 9 inches in circumference, with the flowers set on from bottom to top. Of late years much improvement has been effected in the size of the individual flowers and the breadth of their lobes, as well as securing increased brilliancy and depth of colour. The peculiarities of the soil and climate of Holland are so favourable to their production that Dutch florists have made a speciality of these and other bulbous-rooted flowers. Large areas of ground are devoted to the growth of Hyacinths in the vicinity of Haarlem, and are estimated to bring in huge revenues. In the spring garden the Hyacinth makes a very effective display dotted in clumps in the flower borders and arranged in masses of contrasted colour beds. There are no flowers which impart during their season a gayer tone to the parterre.

The new Narcissus Brawardine

Very pale primrose-coloured self of the Giant Leedsii type, and well expanded trumpet of great substance and broad waved perianth segments

The origin of the much-beloved Daffodil is lost "in the twilight of fable," and through the ages the production of new varieties has proceeded at an annually increasing rate. A comparison between the little wild Daffodil to be found in the woods and the meadows with the flowers exhibited at the shows provides some idea of the extent to which culture has been achieved by the experts. The present-day cult of the Daffodil, however, commenced about a century ago, when the then Dean of Manchester raised Daffodils from seed obtained by crossing varieties of the wild species with each other, thus laying the foundation of a department of horticulture which has now developed to considerable proportions. Many others carried on the good work of the Dean, and ultimately the Emperor and Empress trumpet Daffodils in yellow and white varieties appeared. The result of the culture was that Daffodils increased in size and bloom, accompanied, however, by a certain coarseness in some of the famous varieties.

Owing to its stately beauty the Tulip has been a favourite in European gardens for two or three centuries, and has been crossed and recrossed until it has become almost impossible to refer the plant to its original types. The lovely flowering Van Thol Tulips, the segments of which are mostly scarlet with



Narcissus Fortune, the forerunner of many new hybrids

yellow edges, are derived from a native plant of America, and Central Russia is the place of origin of some of the later-flowering varieties. The Tulipa sylvestris, with elegant, yellow, pendulous flowers, is a doubtful native of England. At the present day Tulips are less fashionable than they once were, and, consequently, the enormous prices given for new or improved varieties no longer obtain. It must, however, be remembered that the Tulip mania of the seventeenth century was really a form of gambling, in which admiration for the flower and interest in its culture were more often than not secondary considerations. Tulips were introduced into the low countries in the sixteenth century from Constantinople and the Levant by way of Vienna and Venice.

Though in all three cases the propagation of the bulb is largely centred in Holland, affording a very prosperous business to the Dutch expert, large consignments of the cut bloom are grown on English soil, including, of course, the Channel Islands. The delightfully mild climate of the Scilly Islands encourages the growth of spring bloom there in wonderful profusion, and the seafarer who has had the good fortune to be carried within a short distance of these shores in spring will retain the experience in his mind for a long time.

Finally, we can realise how much to the Tulip the public parks of our cities owe their spring beauty by the existence of this very popular bulb.

ARTHUR HASLAM.

New Daffodils

THE first list or catalogue of E
with the new prices for 1929, h
received from R. F. Calv
Coverack, Cornwall. None of the co
varieties are included, and therefore
new and choice Daffodils, which a
described, make it a useful reference
all who are interested in Daffodil-g
quite apart from the fact that in ev
Mr. Calvert has reduced the prices
year and in many cases the reductio

Bearded Irises: "Eastern pallida" forms and their descendants

SIR ARTHUR HORT'S notes in your issue of January 26th on the Eastern forms of Iris pallida are, like all his writings, of great interest. He is one of the few, nowadays, who can recollect personally happenings with Sir Michaël Foster at Shelford.

Regarding Iris Cypriana, I am afraid I cannot now identify the plant that Sir Michael grew, although I have now under cultivation a stock from a source which I believe has been growing in one garden for 25 years or more. Of its earliest progeny I have, however, clearer recollections.

My first acquaintance with Iris Caterina was as follows:—One hot morning in May
many years ago I walked the dusty
road leading from Shelford Station
Wells, and up the long drive, passin
left hand the border of Eremurus, th
best, and met Sir Michael at the fro
On the left hand was a small gr
on the floor of which stood a large
taining a magnificent Iris in flower.
so taken with its beauty that I imn
asked Sir Michael, "What is that?
even asking him how he was. He
his pipe from his mouth, and with his
teristic smile and chuckle, replied
that is Caterina," and together we
its beauty for a few moments in sil
can still picture the scene and the b
the flower, though over 25 years ag

Regarding the Iris Ricardii seedlin
tioned by Sir Arthur, the following m

bearing on the matter. We used to ve from the late William Siehe, of sina, immense rhizomes of an Iris called nia, which produced tall spikes of very , deep blue flowers, most heavily ed. The spikes, as the blooms de- ed, were so heavy that they generally psed on to their side. It was early in century that I first received collected of Junonia from Siehe. The flowers the largest of any Iris I have ever seen habit Mme. Durand is very similar. I plants of this to Sir Michael Foster, after flowering this Iris, came to the usion it was very similar to what he originally grown as Cypriana, which ob- tion was mentioned in "The Gardeners' nicle," July, 1905. I rather fancy that gh it was similar to his Cypriana he it out to be a bigger, bolder plant. In ng Dykes' book one is struck by the ecture that he made as regards the close nce of Junonia, mesopotamica, and tti. It seems to me quite possible that Michael's Cypriana plant might have a piece of Junonia that originally came from Asia Minor, hence the similarity he two. One of its most distinctive ires was its very heavy scent.

nother Eastern Iris which is responsible many garden hybrids is Iris trojana, at time distributed by me as Iris asiatica, r which name it received an Award of t from the R.H.S. The history of the duction of this plant as far as I am con- ed might interest readers. I was in Pro- e and Morris's rooms many, many years about October, 1895, when a small bag t the size of a peck measure was put up ry dry Iris rhizomes. Messrs. Protheroe Morris's head man, the late John Kelk, known to frequenters of the rooms, ed my arm and whispered to me: "You better buy these, sir, they have come the East." I therefore made a bid of and secured the bag. There were many dred rhizomes, and I planted them up in open in a field. Of course, the first year did not do much, but the second year were glorious, growing as much as 4 high, with branched flower-stems bear- magnificent-sized blooms. I took some hese to London and showed it as Iris ica at the R.H.S., where the late John ker, of Whitton (who was a great plant), said to us what a wonderful plant it It was since written of in the old urnal of Horticulture." Curiously gh, although the bulk of the rhizomes h I planted were Iris trojana, there was rtain mixture of orientalis and also a in number of Iris albicans flowered ngst them. These two species seemed to widely spread through the East. This probably the original introduction of trojana into our gardens. I sent it to Michael Foster, and he used it as a nt. Iris Shalimar and Stamboul are al hybrids of this true trojana. I have had the real plant for many years, ough I believe it masquerades in some ens under the name of Cypriana. It shows how mixed these Eastern forms and the difficulty of identifying them on material that is passed about from hand and to different gardens from time to .

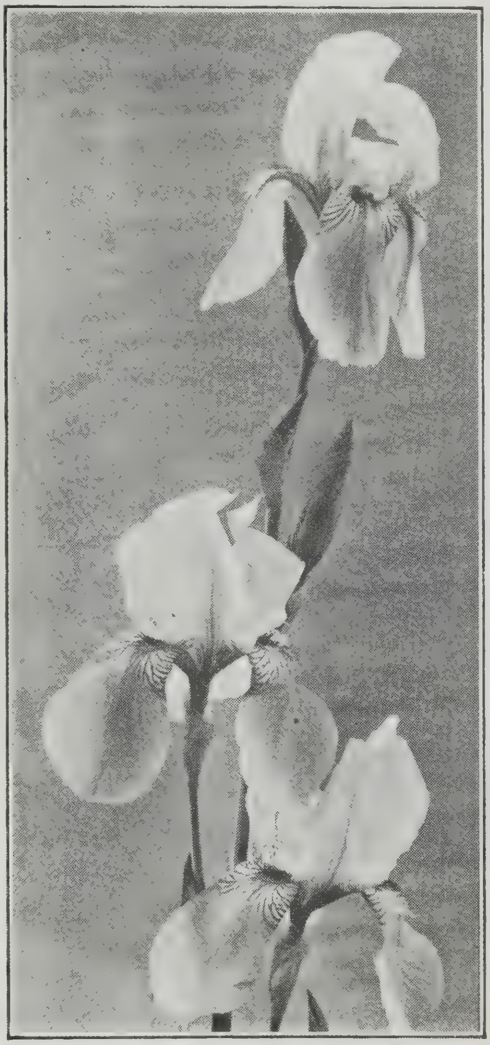
nbridge Wells.

Sternbergia and Dietes

ere seems a good deal of confusion about different varieties of Sternbergia. At ord the first to flower is S. Clusei, a very flower which is produced simultaneously the leaves in August. Next follow rent forms of S. sicula, which appears to e correct name for S. lutea, including the variety S. angustifolia. S. sicula begins with the variety S. s. cretica, with small, narrow leaves which lie flat on the ground. The flowers are also small and produced freely. S. s. græca is similar, but the leaves are upright. Next follows the type, S. angustifolia, of commerce, in which the dark green leaves are upright and the flowering season extends through October and November. Another variety of S. sicula I collected at Tlemçen, in Algeria. This has much wider leaves and very large flowers.

The bulb correctly called S. lutea is the species named S. macrantha by the nurserymen. The foliage is wide and the flowers appear before the leaves are fully developed, which is often deferred until the spring. This variety has a tendency to be a shy flowerer. The true S. macrantha is a rare plant and is grown exceptionally well by Major Pam at Wormley Bury, where he has a noble row under a south wall in the kitchen garden. We have had no success with this species, and I believe it has not done very well at Wormley Bury this year. The last Sternbergia to flower is S. Fischeriana, which appears in March. It is, apparently, a variety of S. lutea, and requires a hot, dry place for success.



Iris Stamboul

An admirable garden form, vigorous and free flowering, a typical hybrid of the true Iris trojana

As a general working rule it may be said that the Sternbergias that produce leaves with the flowers like a fairly heavy soil, and do not require nearly as much sun as the varieties that produce flowers before the leaves. These must have a well-drained sandy soil which is baked in the summer.

Mr. E. A. Bowles' article on Dietes gave me much pleasure. My experience coincides exactly with his. I think D. spathacea and Huttoni must be distinct species. The latter is an unsatisfactory plant here as it invariably gets cut, but I have seen it growing splendidly in an old orchard in Devonshire, where it formed a clump 6 feet across. D. iridioides Johnsonii is a great improvement on the type, as not only are the flowers much bigger, but they last much longer. There is another variety called D. i. Macowanii, but this is very similar to Johnsonii. An interesting plant is the New Zealand Diplarrhena Moræa. This comes from Australia, and is exactly like a dwarf form of Dietes iridioides. I raised two plants from seed supplied by the Edinburgh Botanical Gardens, and put them out in my desert garden. They now appear to be dead, but I saved plenty of my own seed. A most interesting class of Iridaceous plants, Marica, closely allied to Dietes, comes from tropical Africa. Marica cærulea and M. gracilis are two of the most beautiful stove plants I know. The first is bright blue and the second white, with the most marvellous markings in tortoiseshell and other colours on the standards and hafts. They reproduce themselves by small plants which are formed at the end of the flowering spikes.

Burford Dorking. William Lawrence.

—— Sternbergia lutea, like a cup of gold, was flowering profusely in the Tatoi garden of the late King of Greece, but only in the stone walls and stony banks, where it seemed to be wedged tightly between the stones. As the soil is everywhere full of lime this may, perhaps, answer S. Arnott's question. Grapes were being gathered in great quantities and in several varieties, but beyond a few belated Cistus flowers nothing else was out. This was in October. As the hills in spring are ablaze with Anemones I feel sure lime was everywhere.

A. Martineau.

Sweet Chestnuts

With reference to Mr. Davis' inquiry and the reply, the large-fruited Sweet Chestnut, of which a large number of varieties have been raised in France, is grafted on the ordinary Castanea sativa. Perhaps the best-known and most easily procurable variety is Paragon. Doré de Lyons, sometimes called Marron de Lyons, is another good one; Numbo and Nouzilland both have very large fruits. It is generally the case that the Sweet Chestnut has to make a tree of considerable height before it bears good fruit. I am told that the Japanese Chestnut, C. crenata, Siebold (C. Japonica, Blume), the Tamba, matures more rapidly. It is probably the largest-fruited Chestnut in the world and produces fruits 5 ozs. in weight. I have two trees, apparently grafted on the wild Japanese Chestnut; they have been planted five years and refuse to get away.

William Lawrence.

Bullfinches and buds

I saw, issue January 19th, page 48, a reader inquiring for suggestions for repelling attacks by birds on fruit and flowering shrubs, and send the following remedy which I have found effective on standards of Pyrus Eleyii and others, which consists of throwing a reel of black (as it is invisible to birds) cotton backwards and forwards over and through the branches and twigs, making a network, which in no way interferes with the leaves or flowers. I employed the remedy on a large bushy, half standard Pear, 8 feet to 10 feet high, which we were told never bore any fruit, and the result was that it was loaded with large Pears this year. It should be possible to do this to taller trees, with one person each side of the tree. OLIVE E. WADDY.

Taunton.

Iris unguicularis

WITH reference to the recent notes on this Iris, I think the question of its flowering or non-flowering depends less on the cutting down of its foliage than on its position and soil in which it is growing. Again, there are several distinct forms of this beautiful Iris, and these vary considerably in flower and foliage, and in time and freedom of flowering. With me the most satisfactory type which I have grown is the variety known, I think, as lilacina. Its flowers are darker in colour, with slightly shorter and broader petals than the type generally seen in gardens. The leaves are also broader. It usually commences to flower about mid-November.

In April, 1927, I planted a narrow bed of this variety about 6 feet in length against the south wall of my house. The natural soil, being stiff clay, was dug out to the depth of about 18 inches. This was replaced with a mixture of two parts well-rotted turves, one part old mortar-rubble, and one part broken bricks passed through a sieve of ½-inch mesh.

The Algerian Iris (I. unguicularis, syn. I. stylosa)

The flowers are cut in bud and brought indoors to open

On November 13th of last autumn I picked the first bloom. Since that date I have never been without a vase of this Iris on my table. Yesterday (February 3rd) 18 buds were gathered, and several more will be ready in a day or so. It is always best to pick these flowers in the bud stage as they open well in water.

The leaves of the above were not cut back last summer. Probably in the case of old crowded clumps the cutting back of the foliage is an advantage, in that it allows more sun to get at the rhizomes.

Wells. L. BIGG-WITHER.

—— I venture to send you my experience with these invaluable winter-flowering plants. I have 11 large clumps planted 15 or 20 years ago in a very poor border beside a greenhouse facing south. For the first few years I had very few flowers, but since then they have never failed me, and the number steadily increases. This year I picked three or four at the end of October, and no day has passed since (except a few days of severe frost in January) that I have not found a little bunch. The numbers increased up to 10 to 15 a day at Christmas, and now I am getting 20 to 30. This morning (February 2nd) I found 32.

The plants have never been moved, cut, or divided; all I do is to pick out the dead leaves in autumn that choke them up, and dust them once or twice in the season with Sanitas powder; this not for the plants, but to check the slugs, that destroy so many of the flowers. I find they are best picked in bud. M. B. MIREHOUSE.

The Hall, Angle, Pembroke.

—— Iris stylosa grows almost like a weed here in the open border. The soil is heavy, a clayey loam. I broke up a large clump about three years ago in the spring, and every little bit I planted has been producing flowers—the larger pieces in great abundance—all through this winter in spite of the slight frosts we have had. The white variety does not flower quite so freely. This was a very small, weak fragment when I planted it, but is now growing away and flowering quite well.

The Knoll, Exmouth. A. H. T.

—— This beautiful winter-flowering subject is a native of Algeria and requires a position close to the base of a wall where slight protection can be given them during the more severe and frosty weather. This Iris requires a rich, well-drained loam, and should be given copious supplies of moisture during its growing season. In these gardens we have a border facing south planted with these subjects, which gives yearly a wealth of flowers during the dull winter months. The flowers are of a lilac colour with a white throat streaked with gold, and are very useful for cutting, but require cutting in the bud state if wanted to last any length of time in water. These, when arranged in transparent vases with Maidenhair Fern, look very effective.

E. BAKER,
Head gardener to Mrs. C. L. Bourne,
Garston Manor, near Watford, Herts.

Rock gardens at Chelsea Sho

My real purpose in replying to the le
the Secretary of the R.H.S. has
achieved. It provoked discussion and
it certain that the letter would not be
looked. In this, my final word on th
ject, I should just like to repeat that I
sonally, have no preference for one
stone over another, and have used at

One little effort of his at side-step
must notice. Limestone *can* be "emin
suitable for two different purposes, pro
there are other purposes for which it
used (and there are). If I had sugge
was pre-eminently suitable for either, o
his pedantry would have been exc

ugh it might not have added much to the ter under discussion.

'Sandstone" in a recent issue tells a ty story about a fine rock garden con- rcted with stone raised on an estate by estate labour. If the labour was efficient i is exactly as it should be. He leaves us dering how this would assist any par- ar exhibitor at Chelsea towards bearing expense of demonstrating the use of that icular red sandstone. Purely as a matter hoice I would rather take grey limestone y from its locality and use it anywhere red sandstone, and, judging from his vious remarks, so would "Sandstone." sh he would tell us why.

M. F." suggests that a few cartloads of nstone tipped on the ground would make passable rockery," but that other stones ld *not*. Does this not imply that the nstone is a better material than the others? M. F." is right it is so suitable that you not go wrong with it. Who is there that, ning to make anything, looks round for less suitable material for the purpose? h things have been done, and they usually e labelled somebody's "folly." But the is that a few loads of sandstone tipped on ground would make an equally "pass- rockery." Passable is exactly the right d if one overpasses quickly enough to d seeing it. In any case I am sure her "M. F." nor anyone else wants ssable rockeries" at Chelsea.

hen Mr. F. Baker suggests moving the gardens to another site he is right in king it would bring about a change of n. He overlooks the fact that the R.H.S. at considerable expense, introduced a ial water supply and drainage system on rock garden site, and the correspondent ted by "M. F.," in using the term nevolent" in connection with the R.H.S. ncil, was not necessarily thinking of the rality with which it meets the requirements of exhibitors. I make another sugges- that is just as likely to be carried out. main avenue now devoted to sundries ht to be the most attractive picture in the le show. It is the point that visitors m Hospital Road see first, and could be le very imposing.

A. C. C. W." asks for Welsh stone to sed more. There is some very beautiful e in North Wales. It is of the same ogical formation as the Westmoreland Yorkshire limestones, and extends right oss to the West Irish coast—Galway, for ance. The rock garden at Earlham Hall home of the late Mr. Sydney Morris) was structed with the North Wales stone, and as been used at Chelsea Show. I think s more attractive than either Westmore- d, Yorkshire, or Cheddar stones, but the (away from its home) is enormously in ess of any other. If "A. C. C. W." in- led to imply that Red Jasper would be a sful stone for a Chelsea exhibit, well—Mr. od tells us Chelsea nowadays presents a oeful lack of the spirit of experiment," here is a chance for someone to prove he vrong and attain notoriety. If he refers he real Red Jasper he need not even plant t.

ome *in*, Mr. Elliott, you *are* wel- e. I have been expecting you for some e. So you think waterworn limestone the one rock above all others which is itself to pretty building, can be obtained dy weathered, and of good colour." And that it is "very unlikely exhibitors will up using it as long as the R.H.S. con- ne, etc., etc." Heartiest congratulations your tabloid paraphrase of my first letter the subject. I am afraid I have ap- iated neither the injury to my dignity (or n that I had any dignity) nor Mr. Wood's ty whirls around it. Mr. Wood is a *serious* contributor. To him it is a *serious* subject. Has he not assured us of this in plain terms? To whirl in giddy "rings" is surely incompatible with the gravity with which he regards the subject. I wonder how Mr. Wood will regard Mr. Elliott's deprecation of his "realism." He might quite reasonably ask him how the "*imitation* by others of his own *inimitable* style" could be achieved. It does not sound easy. There is also something curious in the suggestion that the farther Mr. Wood gets away from realism his work becomes "surely better." Recently Mr. Wood pounced avidly on my suggestion that he was a "great artist" in a manner that hinted that he had observed a slip in my reasoning. I was perfectly sincere, and intended just what I said. I consider that, as a "realist" in rock construction, Mr. Wood is a "great artist," an opinion I have held for many years, and which not even Mr. Elliott's contempt of this application of the term "artist" can change.

GEO. DILLISTONE.

Collecting wild flowers in Southern California

Having just returned from a collecting trip in the southern part of the State, where I gathered quantities of seed of Zauschneria californica, the paragraphs in the October 13th number of GARDENING ILLUSTRATED, written by E. Markham, about this glorious plant, at once attracted my attention.

It is satisfying to know that this sun and drought loving plant is being grown so successfully in England, and the conviction that if anyone can grow a plant the English can is once more justified.

Zauschneria (commemorating Zauschner, a Bohemian botanist) blooms here in late summer, throughout the autumn, and well into winter, and fills a need at a time when wild flowers are scarce. It goes by the common name of California Fuchsia, while in the south it is often called Balsamea. The Spanish Californians used it as a remedy for cuts and bruises.

One wonders why this vivid plant is used so little in gardens. It is easy to grow and the mountain variety (Z. latifolia) is hardy, as it is occasionally found in gardens of the Eastern States and flourishes at an altitude of 9,300 feet in the Sierra Mountains, where it is particularly beautiful.

Zauschneria is found on rocky hillsides and dry benches. It has a brave manner of finding its way among rocks and rough bushes, and poking up a triumphant flower-head from some inaccessible crag or shrub on the canon side. It seems to have an affinity for Rhus diversiloba, as I found to my sorrow, for this poisonous bush retains its villainous propensities even when its drying foliage is the brightest among the autumnal colourings.

G. LESTER ROWNTREE.

Carmel, California.

Proposed Society of Garden Architects

Your correspondent, "F. R. H. S., Brighton," seems to have been unfortunate in his dealings with garden architects. Need he, though, one feels entitled to ask, wither the entire profession in this wholesale fashion because of his own unhappy experience? One sees the plans for a typically modern "jerry-built" bungalow, but does one necessarily go home and write to the Press a sweeping condemnation of the architectural profession as a result? I think one would exercise a little more restraint, perhaps, than that. In the same way, whilst I have no personal animus against your probably well-intentioned correspondent, I could yet wish that he had directed his wrath against those responsible for the preparation of the particular plan which aroused his displeasure rather than condemned the whole profession.

Further, I would point out that it is just the production of bad plans, such as we will suppose for the moment this one was, that the proposed Society is designed to prevent. Admittedly, much disreputable work, both in the matter of design and in execution, is being carried out to-day. At the same time there are men, in addition to the "good, practical foreman," who make it their business to study garden design from every aspect, and it is such men as these who would form the nucleus of the Society. Indeed, everyone who belonged to it would have, as a matter of course, to possess the necessary qualifications, and in this way it would provide a guarantee for the public of good work.

By all means have your "good, practical foremen." Such men are invaluable, and their worth is fully realised. In fact, the construction of gardens should always be done by them. Perhaps, however, your correspondent does not quite realise what more there is in this matter which he dismisses so lightly, and upon which he has the air of considering himself competent to give final rulings. If he did I think he would not be quite so ill-disposed towards the term Garden Architect. A garden *can* have design in it, and it can also have a considerable number of architectural features.

Formal terraces, balustrades, steps, walls, garden houses, and seats are all architectural features, and for this reason your garden designer requires a knowledge of such architecture as this, and more especially of planning, in addition to his knowledge of plants. Admittedly, the architect pure and simple will often put far too much stonework into a scheme, but so, on the other hand, will the plantsman pure and simple generally put no design into his.

No, it is undoubtedly true that the really successful maker of a garden to-day must combine a knowledge of architectural design and an artistic sense with a knowledge and understanding of plants and their ways. Consequently, I consider the term Garden Architect to be not only a suitable name for him, but an expressive one. Perhaps Landscape Architect is the next best.

To return to the immediate case, even here, apart from the general conclusions your correspondent has jumped to, he may have been a shade hasty in his judgment of the plan he describes. One cannot tell, of course, without seeing it, but what does strike one in reading his letter is his singular description of a pergola as a "gadget," and, again, of the placing of a Rose garden under the sitting-room windows as another "gadget." I have heard this strange term used quite expressively, but I must confess that in this connection it appears to savour rather more of a desire to be abusive than of a sane criticism.

Again, he describes these things as being in the fashion (whatever he may mean by that). Apparently one must on no account be in the fashion, and in order to avoid committing that breach of taste one must not put a pergola in any garden unless one can conceal it from view from the house; and, further, one must keep all Rose gardens well away from the windows. (Rose-lovers all over the country please note that you must never have your favourite flower under your windows, at any rate unless well diluted with something else, because, although it can give you a feast of colour and scent from June to October or November, it will look "untidy" in winter.)

The suggestion of your correspondent that one should obtain guidance from old gardens is admirable—one can only wish that the rest of his remarks had been equally helpful. On the other hand, if he follows it up himself I am afraid he must not be shocked if occasionally he finds a Rose garden under the windows. In Elizabethan times, for instance, they invariably had, if not actually a Rose garden, at least formal bedding out under the windows, which, I fear, could not hope to fulfil his requirements in the matter of winter effect. In fact, taking things all round, I should say that our gardens to-day had very much more of interest in them in winter than the old-fashioned ones, delightful as many of these were.

In conclusion, I must just point out that the finest of these old gardens to which "F. R. H. S." draws our attention were generally laid out by one or other of the men who founded and carried forward just those traditions of garden architecture which we are endeavouring to uphold to-day. Admittedly the difficulties are great, and shoddy work has already gone far towards bringing the craft into disrepute; in fact, that is precisely why we want this Society. But in spite of the cold water poured so ruthlessly on the attempts that are being made to improve matters by founding the Society it will come in the end. And when it does I believe it will live to justify its existence, and help to maintain the traditions of that art which has been called "the Mistress of the Liberal Professions."

F. C. SURTEES ROBINSON.

—— I have read with considerable interest the correspondence in your columns with regard to the formation of an Association of Garden Designers, and in response to my suggestion in a previous issue I have received a number of interesting inquiries.

It has been decided, therefore, to convene a meeting at 9, Gower Street, Bedford Square, W.C. 1, on Wednesday, February 20th, at 7 p.m. Those wishing to attend should send a stamped and addressed envelope for an invitation.

RICHARD SUDELL.

9, *Gower Street, Bedford Square,*

"When idols have feet of clay"

May I be allowed to suggest that the adverse criticism of Meconopsis Baileyi by your correspondent, "J. R. K.," may, perhaps, have been influenced by psychological as much as by horticultural factors?

"J. R. K." says that "perfection must always be our ideal, horticulturally as otherwise," but to the ordinary man such a standard seems a little grandiose and likely to beget a tendency to depreciation which will not be entirely objective. Such considerations would be out of place here were it not that a genus so variable as Meconopsis is capable of being improved in garden value by selection, and the more widely it is grown the more rapid will be the process of amelioration. Over-praise will check the spread of a plant in cultivation, but the disparagement of a disillusioned idealist is also an effective deterrent—if it is taken at its face value.

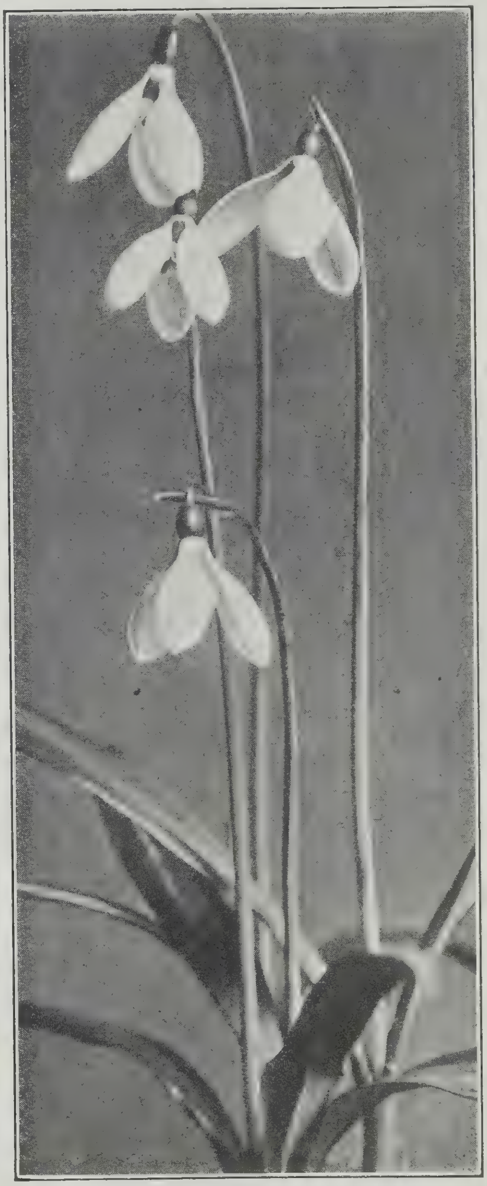
"J. R. K." says that Meconopsis Baileyi "is a washout in five plants or five gardens out of six." This seems rather a high proportion, for I have seen the plant sky-blue and flourishing—when it has been given a liberal supply of leaf-mould—in four quite different soils and climates. But no doubt "J. R. K.'s" experience is larger than mine.

I have found, as "J. R. K." complains, that vendors often over-praise their goods, but I have not found that this deplorable weakness of human nature is greater in nurserymen than in other tradesmen. On the contrary, I have the impression that nurserymen's catalogues are more truthful than the literature of patent medicine vendors, company promoters, and others which fills my waste-paper basket.

The nurseryman often warns us that a plant is difficult, that its flowers are "vivid magenta," or he adds an explanatory "lilac-pink" in brackets after a variety called "Maiden's Blush." In general, he seems to me (judged by the ordinary commercial standards) to treat his customers with commendable frankness.

I am sorry if Meconopsis Baileyi has given "J. R. K." more pain than pleasure, and I would ask him to give it another trial if only he did not cherish that ideal of perfection, but it is not as easy as Arabis nor, like the sky, is it always blue. I should, however, like to point out that the words "ideal" and "idol" are quite closely related, both in origin and meaning, and that if an idol has feet of clay the shortcoming must be blamed upon its maker.

F. A. HAMPTON.



Galanthus byzantinus

Clematis Flammula

The illustration and notes accompanying same interested me, knowing what a beautiful effect it has where it is allowed to grow at will, its long-reaching shoots hanging in all directions when the majority of climbers are about spent out. Some six years ago I purchased a plant from a reliable firm, planted it so that its shoots should overhang the window where most of our time is spent
when work is done, hoping to get a w
of its lovely scent when in full flower.
it turned out to be a scentless variety
my great disappointment. It was certa

Cupressus macrocarpa

Your correspondent, "H. G.," in
issue of December 29th, has offered a
timely warning *re* this beautiful Cy
Having had some years' experience with
plant I can endorse all he says and
some suggestions to those who hav
established hedge. My experience of thi
ject, gained in the once beautiful garde
Killarney House, where one could see
Cypress to perfection, was that whe
hedge had grown to the dimension of 1
high by 6 feet through (as it was at Kill
House) it was very apt to go off in pa
I found this was caused chiefly by the
mass of growth throwing off the rai
much so that the plant got dry and
poverished. I got over all this by di
out the soil to a depth of 3 feet each s
the hedge, and replaced this by fre

iden soil, and in a couple of years the bad ches were filled in again and the whole nt rejuvenated.

have never seen anything to approach Cupressus; when once the hedge has ched perfection there is something about that is so soothing to the eye which uld encourage anyone who is in a district ere there is some prospect of it succeed- ; but if planted and neglected as " H. G." ntions, the only remedy is to plant young s between the existing cut-backs to fill the bottom of the hedge, as a cut-back generally only break at the tips.

Iaving the following built up into hedges, , Escallonia, Euonymous, Bay, Portugal urel, Berberis Darwini, Laurustinus, oressus Lawsoniana, Beech, and Yew, in above-mentioned gardens, I was natur- interested in any subject I came across d for this purpose, and the most unique ge I have seen was at Shanes Castle, Co. rim, made up with Irish Yew, about 16 high, and feathered from top to bottom. m not sure, but I fancy this was not ped, but tied in in the ordinary way, yet e of these mentioned can be compared h Cupressus macrocarpa where the condi- ns are suitable. A. J. ELGAR.

Vard End Park, Birmingham.

Strangweia spicata

HIS interesting little variety is flowering here in an unheated house. It needs to be on a slightly larger scale and a little er in its colouring to be beautiful. It ks like a compound of a Chionodoxa, a schkinia, and Scilla italica. The flowers set in too close a spike to have the grace a Puschkinia. They do not open freely ugh to compare well with the stars of a onodoxa, and the white ground has a e of greenish-blue in it, while the bright tips and median stripes of each seg- nt are only found on the inner surface. erefore it is needful to look closely to ap- ciate the charm of the little plant. Its ves are the longest parts of it—some nches long—and it has had more names en to it than there are inches in those ves. It is Hyacinthus spicatus in Sib- rp and Smith's Prodromus of Greek nts. Boissier placed it as a Bellevallia, latore called it Foxia, Bertolino angeveia hyacinthoides, and Kunth schkinia dubia. One might think it had n specially created for the purpose of ng botanists something to argue about. tunately, Nature gave it one very curious racter, a pair of bracts below each flower ch seem to be put on the wrong way up. ey remind me a little of those on the la that often does duty for S. italica, and been called, rather doubtfully, S. sseniaca. But Strangweia's bracts are e extraordinary in shape, no two of them ng exactly alike, and, once noticed, uld serve to recall the plant to the mind any botanist.

t looks as though the reflexed, downward nting portion of each bract might be of vice in preventing small insects from wling up to chew the flowers or rob them pollen and honey.

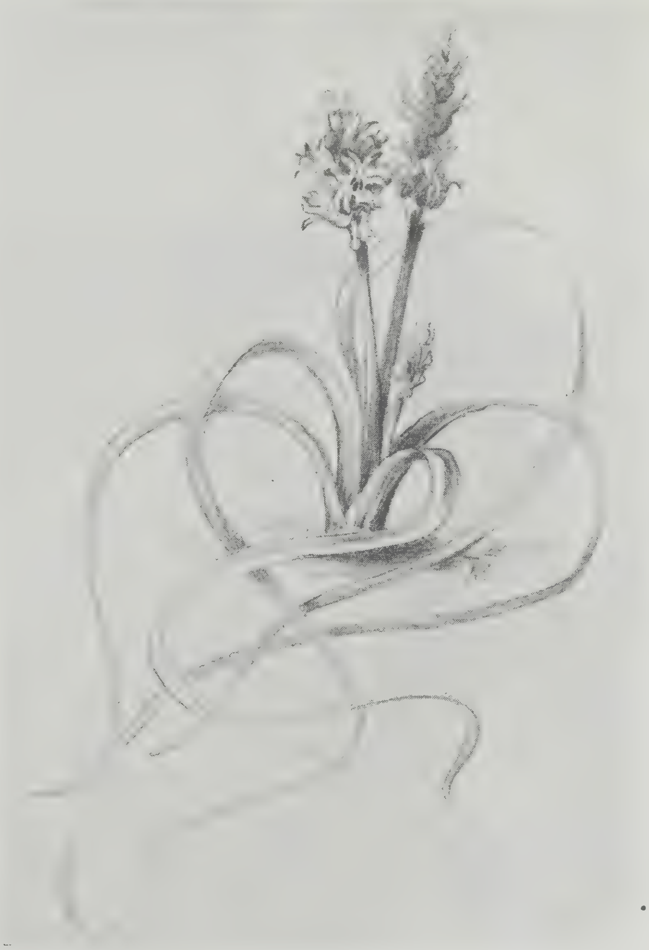
t is the only species known, if the genus angweia is considered distinct from acinthus, and it has been found in a few es in Greece.

My specimen came from Eleusis and wers freely, bearing three spikes from the b. So far it has made no offsets, but ripened seeds. If the leaves, which ap- r in autumn, will stand our winters it uld be a pleasing plant for the scree bed, t flowers from December to April.

should like to know if anyone has suc- led with it in the open.

There is a good figure of it in the Botanical Register, t. 1869, in the volume for 1836.

Waltham Cross. E. A. BOWLES.



From a drawing by E. A. Bowles

Strangweia spicata

Lavender hedges

I have noticed how frequent are the complaints made to the Editor regarding the unsatisfactory condition or the failure of Lavender when employed as an ornamental hedge plant. Having had considerable experience with Lavender when used for the formation of hedges of some 3 feet to 4 feet in height, it is, I must admit, from a durability point of view, the least satisfactory of the various subjects laid under contribution with which to form a low-growing hedge.

At the same time it may be stated that with the exercise of a little forethought and judgment this difficulty may be overcome by anticipating the period when deterioration begins to show itself in having a supply of plants in readiness to supersede them.

With properly prepared soil, that is, double-dug and enriched with well-decayed manure, a hedge of Lavender will, according to my experience, remain in good condition about eight years. After this the side branches are apt to become partly detached, and lie sprawling on the ground, while some plants will unaccountably lose some of their branches or die outright.

It is when these occurrences begin to take place that the old hedge should be dug up and a new one planted with examples of good bushy habit some three years old, which will yield a good supply of flowers the following season if planting takes place in the autumn.

Suitable-sized plants can, of course, be purchased, but they can, if space is available for so doing, be raised on the spot. This is a very simple process, all that is necessary in the first instance being to select strong, healthy side shoots to the required number and detach them with a heel from the parent bushes.

Beyond trimming the ragged edges of the "heels" and the removal of a few of the lowermost leaves no further preparation is needed. The " slips " or cuttings should then be dibbled in or planted 6 inches to 9 inches apart in rows 12 inches apart on a border of any aspect except that of north, the soil of which is in good condition from having been well dug and manured for a previous crop. Propagation may be effected about the end of August or early September, and should be carried out some two or three seasons beforehand, according to the size the plants will be required to be. The young plants should be lifted and transplanted each autumn, when, to admit of their becoming robust and bushy in habit, allow plenty of space both between the plants and rows.

Many imagine that Lavender may be close-clipped after flowering each season, but it resents such treatment, and I have found that a light trim-over after the flowers have been cut, or trimming the stems to maintain symmetry and alignment when the spikes are allowed to remain until the flowers have faded, particularly if the hedge is straight and of any length, is all that is necessary.

Some may demur at going to all this trouble in order to keep a Lavender hedge in a satisfactory state, but the effect produced, especially during the blooming, is ample compensation when such attention as that outlined is bestowed on its care A. W.

Anemones at Creagh Castle

THE Anemones here are a perpetual joy, as they flower nearly all the year. They began flowering in August, and we have had two tables covered with large bowls of them ever since. I find now one must be absolutely ruthless with them, and if I see any washy-coloured mauve ones I dig them out at once. I am profiting by the result this year, as some of the colours are splendid. There is a plum-coloured one I have been trying to fertilise, and, much to my joy, many plants have come true to colour this year. There is no doubt Anemones love a sunny position and lots of manure, and they are the grandest flowers for lasting in water. In the spring these beds really are every colour of the rainbow. DOROTHY BUCKNALL.

Creagh Castle, Doneraile, Co. Cork.

Borders of many colours: Anemones at Creagh Castle

The following fairy tale was inspired by a visit to Creagh Castle during Anemone time:—

Once upon a time a little girl was walking in a beautiful garden when, out of a large Daffodil, hopped a lovely green goblin, and said: "Little girl, walk with me"; but the sky got darker and darker, and large raindrops splashed down, then a flash of lightning and a terrible clap of thunder. The little girl seized the goblin and ran into the summerhouse, where she popped him into a comfortable seat and sat down beside him. "Little girl," said the goblin, "I will give you two wishes." "Oh, dear goblin," she said, "my first wish is this storm should stop," and immediately out came the sun and a beautiful rainbow right across the sky. The little girl stared at it for some time and said: "Now, good goblin, I see my second wish, please give me the rainbow." So the goblin said: "Shut your eyes and come with me," and off they went through the garden. Then the goblin gave her a kiss on the tip of her nose and flew away. The little girl opened her eyes, and where was she standing but in the middle of the Anemone bed.

The modern Border Chrysanthemum

THE year 1928 will no doubt be remembered by many growers of the Queen of Autumn as one of the most successful of recent years. Despite the severe frost experienced throughout Scotland on October 1st (we had 10 degs. in mid-Fife), which severely crippled all outdoor Chrysanthemums, they made a marvellous recovery, and during the last three weeks of the month the display was much superior to any we have had for several years.

In consequence of the bright show made by these charming plants we have had many inquiries regarding the most suitable varieties to grow by many admirers who are prospective growers. Successful seasons such as we have passed through give a decided fillip to gardening, which causes us to look forward hopefully to the coming year.

Another factor which no doubt has added interest in the culture of the border Chrysanthemum is the great improvement in the varieties sent out in recent years. The Masse family, which for years held a high position as the most floriferous and hardy amongst border varieties, has now been eclipsed and ousted by varieties in every way superior as far as cut-flower producing and garden decoration is concerned.

I do not intend in these notes to enter i
the culture of these favourite flowers,
with the Editor's permission I purpose m
tioning a few varieties which have provec
be suitable for our Scottish climate, and h
the list may be helpful to some who may
a bit at sea looking at the long lists app
ing in nurserymen's catalogues.

WHITE-FLOWERED VARIETIES.—We h
quite a number of good white varieties
will confine my notes to four, viz.: Count
a very fine variety producing excellent blo
of great purity and, when disbudded, of la
size; Mary Colvin, a variety which origina
in Dundee district, is the most prolific var
we have, giving great crops of sn
blooms. Debutante is another sple
variety. It is best disbudded when
blooms attain to a good size. Septen
White is a well-known variety well w
growing, but is rather late in flowering h
and is best lifted and flowered in a
house.

PINK SHADES.—These are numerous
very useful; one of the best is Mrs. Ja
Scalley, sent out this year by Mr.
McAlpine, Glasgow. Deep rose-pink
colour, it is a free grower and pro
flowerer. This, I consider, the finest o
colour to date. Berengaria (1926), and
deep rose-pink, but quite a different typ
best disbudded. Do not take the buds
early as the later ones give a much ri
colour. Silver Queen (silvery-pink) is a
lovely flower either in sprays or disbud
the latter attaining to quite a large
Shirley Pride, something in the way of
Scalley, but not so prolific and a few t
deeper in colour and rather taller-growin

IN YELLOWS Goldfinder is most useful.
colour is bright, flowers plentiful on g
strong stems. A. A. McAlpine is a
orange-yellow, sturdy growth, free-flowe
and very attractive. Harvester, rich ye
with a tinge of bronze, is a univ
favourite and strong, healthy grower; o
the best. Euphie Ritchie, a beau
tangerine shade, although not too
flowering, should find a place owing t
unique colour.

RED SHADES.—Perhaps one of the p
favourites in this class is Dick Barnes, a
burgundy-crimson which shows well in
ficial light. It produces abundance of
sized flowers on long stiff stems. Cri
Circle is a charming colour, bright cri
flowers carried well above the foliage,
healthy and prolific. Minstrel is deeper
duller in colour, almost maroon; a s
grower with medium-sized blooms.
lotte Harley, crimson and gold, a
flower, but just a wee bit late, requiring
tection when flowering. It is best disbu
when it makes a splendid, massive flow

BRONZES.—Here we have a plethor
varieties, and still they come. It wou
well if those in authority were a little
strict in granting Certificates, as man
cent introductions are no improvemen
existing varieties. Bronze Early Butt
easily heads the list here, both as a
budded bloom and as a spray for cut-
It comes early and continues prod
flowers for quite a long time. Mrs.
Pearson and Mrs. Phil Page are indisp
ble for cut-flower purposes, giving fine,
stems. They are both alike except in c
the latter being considerably darker.
tember Glory is one of the most r
flowers we have, but, unfortunately, a
shy-flowering, but on account of its
shade and form it should not be om
Afterglow, a sturdy-growing variety
ducing on stiff stems beautiful spra
lovely terra-cotta blooms.

Among other desirable varieties in va
shades of colour we have R. G. Colli
real incurved flower of large size, maho

Hamamelis mollis, branches wreathed with bright golden yellow flowers deliciously scented

nson in colour; makes a grand flower dis-
ded; Cranford Red, chestnut-crimson
h twisted petals, a very useful variety for
ting in sprays. Border Beauty, a 1927
roduction, will find a high place amongst
ay varieties. It is very free, with fine
g stems, and the colour bright amber
hed with orange. Albyn, a plum or
nia coloured sport from September
ite, possessing all the good qualities of its
ent, is greatly admired, being a new shade
order Chrysanthemums. Salmon Queen
ine either in sprays or disbudded. The
ms are strong, and when disbudded the
wers attain to a large size. The colour, a
nzy-salmon, is very attractive. Many
re might be added, but perhaps the list is
g enough, as too many names are per-
king. ALBYN.

Seed sowing

eeds of many very choice subjects which
en prove difficult to germinate will some-
ies come freely when sown in pans and
nged in hotbeds made up as above, or
en stood upon their surface. Therefore
tinue with the sowing of those which are
own to require a long time to reach the
dling stage, such as Begonias, Gloxinias,
eptocarpus, Snapdragons, and other choice
vers.

Hamamelis mollis in a Wimbledon garden

THE two accompanying illustrations of that glorious flowering shrub, the Chinese Witch Hazel (Hamamelis mollis) are prepared from photographs taken on February 1st in Mr. Kenneth Wilson's garden at Cannizaro, Wimbledon. This Hamamelis, the finest of the genus, which does so remarkably well at Cannizaro, is protected from the north and east by a dense background of Rhododendrons.

The shrubs are about 9 feet high, and every branch is now wreathed in bright golden-yellow flowers, so bright and luminous that the mass of bloom may be seen from afar.

No matter how cold the winter may be, Hamamelis mollis never fails to produce its curious-looking and deliciously scented rich golden-yellow flowers; indeed, the colder the weather the better it seems to like it. This is by far the most beautiful of the Witch Hazels in winter, and is distinct from all others in summer by reason of its much larger broad, oval leaves.

The fragrance of this Hamamelis is most pleasing, and when the sun is out the scent is carried a considerable distance.

All of the Hamamelis do so well in the light soil at Cannizaro that preparations are being made for planting more. Hamamelis virginiana is the first to open, and was in full bloom in the first week in November.

H. C.

The stately Delphinium

While this majestic hardy plant does not reproduce itself anything like true from seed, still, if the seed be procured from a reliable source or is home-saved from good varieties many very fine colours and forms will eventuate. Any light compost will suit for sowing the seeds in. Pans or small boxes are employed, the seeds being scattered thinly and covered to the depth of $\frac{1}{8}$ inch with part of the compost finely sifted. Give a gentle watering with a rosed can, lay a piece of glass over each pan or box, and then a sheet of newspaper. Set in a gentle warmth of 50 degs. to 55 degs. and germination will soon take place. Prick off into boxes of good soil after the seedlings are fit to handle. Grow on slowly and plant out in rich soil when large enough. C. BLAIR.

Hamamelis mollis, the Chinese Witch Hazel

Lilium pyrenaicum, Martagon section

The yellow Turk's Cap. Flowers heavily spotted black and strong scented

HYBRIDISATION OF LILIES

Considering the advantages of hybridising evidenced in other bulbous plants, notably the Narcissus and Montbretia, it appears surprising that more attention has not been paid to the genus Lilium

If one considers the varieties of Lilium in cultivation one is inevitably struck by the small number of hybrids. It must, I think, be admitted that hitherto the hybrids produced have been the result of accidental as opposed to methodical crossing. If any method is to be adopted one must take into consideration the probable effect one is going to produce, and not proceed along lines of indiscriminate fertilisation under the hope that one may produce something worth while.

This point can be illustrated quite readily from the work of the late Luther Burbank. At one time he had several acres under Lilium seedlings—facilities which are not granted to many—and thousands of Lilies were flowered yearly, yet one cannot but feel that the results produced were unworthy of the labour involved. Liliums Burbanki and Parda-boldtii, the only varieties by which he is remembered, are admittedly worthy of cultivation, but embody no striking advance on previous species or on their parents, Liliums Humboldtii, pardalinum, and Parryi. On the other hand, one can cite the production of better varieties with far less trouble than was expended by Burbank. The late Mrs. Backhouse produced by careful selection of suitable species a series of hybrids which were a distinct advance. In this case the undoubted vigour of the Martagon species was allied to the texture and solidity of Lilium Hansoni. The object, then, to be striven for is a union of two species which possess valuable yet different characteristics. In a batch of seedlings from this source one is almost certain to find a few individual flowers which possess a combination of both characteristics.

Lilium regale is a potential source of some really valuable hybrids. Hitherto the Eulirion type of Lilium—that is to say, the type possessed of a trumpet-shaped flower—has been none too thriving in our climate, such varieties as Liliums sulphureum, Philippinense formosanum, and Brownii only being hardy in very favoured localities. Consequently, it was only to be expected that even when crossed with hardy varieties the progeny would be of doubtful hardihood. By utilisation of Lilium regale one can introduce the Eulirion type of flower without affecting the hardiness of the stock.

Turning to the Martagon, or Turn-cap group of Lilies, one is almost bewildered by the choice. Unless care is exercised in crossing these varieties amongst themselves one is likely to get a rather indeterminate lot of seedlings. No perceptible advantage, for instance, can accrue from crossing Lilium Martagon with one of its varietal forms, or with, say, Lilium pyrenaicum. It is to be noticed, too, that modern taste runs to a self-coloured Lily in preference to a spotted type. For this reason in the Lilies of this class the species which will lend themselves best to the production of distinct hybrids are Liliums Martagon, album, chalcedonicum, pomponium, and similar unspotted forms. For solidity of flower one can do no better than Liliums Hansoni and monadelphum.

A very pretty Lily of the Martagon type which has already been used for the production of a hybrid is Lilium tenuifolium, a dainty Siberian species with scarlet flowers. In itself it possesses the disadvantage of not being truly perennial, but this has been eliminated by crossing with Lilium Martagon album. The hybrid produced—a very lovely yellow variety called Golden Gleam—possesses the grace and beauty of tenuifolium, with the vigour and perpetual characteristics of the other parent.

Although Burbank and others have interested themselves with the hybridisation of the North American Lilies of the Martagon group it is probable that their potentialities are not truly estimated. Hitherto they have only been crossed among themselves wi
recourse to the Lilies of the old world.
amazing vigour of, say, Lilium parda
would be a distinct asset in a hybrid
some members of the Martagon group.
my mind the most valuable of the
American Lilies from the point of vie
the hybridist is Lilium Humboldtii. I
pearance it is not unlike L. superbum
the flowers are more massive and num
It also makes large and strong bul
valuable asset where transplantation is
frequent, as it must of necessity be wi
hybridiser.

In the Isolirion, or Cup-shaped gro
Lilies there does not seem to be the
offered by other types. Already ther
large numbers of hybrids of the elegan
umbellatum class in addition to hybri
L. Davuricum.

The Cardiocrinum type of Lily is of
importance to the hybridist. It is onl
presented by two very similar spe
Liliums giganteum and cordifolium—an
very distinct type of the plants seems t
clude the possibility of successful impr
tion with or of other species. If the
wishes to introduce the tall-growing ch
teristic he can do no better than
Farrer's Lilium centifolium, a tru
flowered species which attains a heig
8 feet to 10 feet.

Of the Archelirion type L. Henryi
think, likely to provide the most va
hybrids. The vigour of the plant is ast
ing, and it seems to thrive everywhere.
flowers, too, are striking and num
Liliums speciosum and auratum seem
ficially to be of value, but actually the
found to possess a great disadvantage.
type seems very dominant—hybrids a
invariably follow the type of speciosu
auratum, more particularly when they
pen to be the female parent. Cross-fert
tion of the two species alone generally
to types which are quite definitely
speciosum or auratum. In fact, so m
is the differentiation that they can be p

(To be continued.)

ilium longiflorum giganteum

ould you tell me when to plant bulbs of um longiflorum giganteum to have them loom by the second week in November? ought of growing them outside in pots in the autumn bring them in the green- se. What is the best compost to grow n to perfection, also how many bulbs uld be planted in one pot (10-inch)?

HARBORO.

To successfully flower Lilium longiflorum anteum in November it will be necessary procure retarded bulbs, and to be certain lelivery at the right time we suggest that place your order without delay, so that essary arrangements can be made for the bs to be placed in a cold store. Three o-inch bulbs can be placed in a 10-inch . Pot them about the middle of July a compost of equal parts loam, leaf- ıld, well-decayed cow manure, and sand. od drainage is essential, and 2 inches of ks or other drainage material is not too ch. After potting plunge the pots in a of ashes made up in a cold frame, cover- the pots to the extent of about 2 inches. lights should be left off except in stormy ther, which is likely to damage the ler growths. Transfer the pots from the nge-bed to the greenhouse in early Sep- ber, giving them plenty of light and air. ter sparingly until growth begins, freely it develops. When in full growth soot-water and liquid-manure may be applied twice weekly. It is also advisable to give the bulbs a top-dressing of similar compost to that used for potting. It may be necessary to give them gentle heat in October, say, 50 degs. to 55 degs. Buds take six to seven weeks to develop from the time of showing when grown in the above temperature. This will serve as a guide. If at the end of September or early October the buds are too advanced retard growth by keeping them as cool as possible. If the buds are developed insufficiently give them a temperature from 50 degs. to 65 degs.]

Dahlias from seed

WHEN the enthusiast has a little time to spare, and the necessary space, there is nothing so fascinating or more interesting than the raising of certain types of plants from seed. Types, too, that do not call for years of patient waiting and labour before they flower, but plants that show their good, bad, or indifferent points in the first season of growth.

In this category the Dahlia calls for special consideration on account of its merits in this direction, its simplicity of culture, and the feasible issue of one or more plants showing distinct advances in form, colour, —or, to suggest a decided acquisition, a variety which would come into bloom a few weeks earlier than the ordinary types.

The Dahlia is partial to a medium heavy, but well-drained soil, and although it has been mooted that heavy dressings of manure are essential to the best results, we have found that land prepared in much the same way as for Potatoes, is all that is necessary.

The site, if not already prepared, should be tackled at once, digging or trenching as deeply as the land will allow, and incorporating in the process a medium dressing of half rotted farmyard manure.

Green or fresh manure should not be used at this time, and, of course, the surface should be left as rough as possible, and only levelled and forked over about a week before planting.

The best types to raise from seed are the "Collarette," "Pæony Flowered," and the ordinary single.

Sow the seed now in a seed pan half full of crocks, and using a mixture of loam, leaf soil, and sharp sand in equal parts, all rubbed through a ¼-inch sieve.

A thin layer of the rougher portions of the compost should be spread over the drainage, then about 2 inches of soil, levelling this down and pressing very gently. The seeds, which are like small spines about ¼-inch in length, should be stuck in at 1-inch intervals over the surface, and finally covered over with ¼ inch of fine soil.

Water thoroughly now through a rose, and place the pan in a temperature of about 55 degrees.

Germination will take place in from ten to fourteen days, and immediately the young plants form their first (seed) leaves, remove the pan to a shelf near the glass.

When the next pair of leaves have formed, pot up the plants singly in 3-inch pots using similar soil, and label each pot with a number, so that any plants which subsequently show special promise when in flower, may be identified accordingly.

When the plants are growing away again the temperature may be reduced a little, and on fine days air should be admitted—avoiding draughts—in order to encourage stocky growth. Dryness at the root will set up "fly," and to guard against this, the soil should be kept consistently moist.

When the small pots are full of roots, re-pot into the 5-inch size, using two parts chopped fibry loam to one each of sand and leaf soil, pressing the compost comparatively firm, as loose potting begets weak, flabby growth.

L. monadelphum Szovitzianum, from the Caucasus
Colour rich canary yellow, spotted black
Martagon type. Note the solidity of the flowers

By the first or second week in April the pots may be placed in a cold frame, standing them on a hard ash bottom, and keeping the light closed for the first few days until they get inured to the change. Air may then be admitted by tilting the lights from the back, increasing this from time to time until they can be removed altogether.

Planting out calls for little comment, but the necessary stake should first be fixed, placing each at 4-feet intervals, and planting one plant at the foot of each.

The Dahlia resents dryness at any time, but particularly so during a hot summer and autumn, and so that labour in watering may be curtailed, and additional sustenance provided, we recommend a good mulch of either old manure, half-rotted leaves, or tannin, spreading this over the surface, about 2 inches deep.

Schizostylis coccinea

I first saw this plant about 25 years ago at Messrs. Backhouse's Nursery, York, where they grew it in a bed of rich loam on the north side of a hedge. I am also growing it here on the north side of a high Beech hedge. This seems rather curious treatment for a South African plant which one would expect to demand all the sunshine it could get, but my experience all goes to show that the plant likes a cool position and light, rich, cool soil. Plants lifted about March or April should be re-planted in a prepared bed of good loam into which a fair amount of leaf-mould has been dug. Divide the plants and plant the strongest shoots about 6 inches apart. With regard to watering it should not be necessary, except perhaps in a very dry summer spell. The advantage of planting on the west side would be that it would get protection from morning sun during early frosts.

REMINDERS FOR THE WEEK

Southern and Midland

Melons and Cucumbers

In well-heated and compact houses make up hotbeds in readiness for these important subjects, the moist heat arising from the formation of such beds being more favourable to healthy growth than when overheated pipes alone are relied upon. The bed should consist of stable manure and good Oak and Beech leaves, and should, when thoroughly rammed, have a thickness of from 18 inches to 2 feet for this early crop. Both manure and leaves should be in a moist condition. Over this place a layer of turf, grass downwards, and at each station add a bushel of the following compost:—Three parts of good turf which has been stacked for six months and chopped to the size of hens' eggs and one part well-rotted manure, such as an old Mushroom bed, and a little bone-meal, the whole well mixed and made tolerably firm. If seeds are sown in pots and plunged in the hotbed they will be of a suitable size for planting out by the time the beds have receded to a desirable temperature.

Propagating

Many stove plants will be found to strike freely now if plunged in bottom heat, and no time should be lost in getting a quantity of cuttings inserted to increase the supply or replace worn-out or unsightly specimens: Acalyphas, Crotons, Dracænas, Gardenias, Pandanus, Allamandas, etc., also many greenhouse plants and other subjects of which large quantities will eventually be required for bedding purposes, such as Heliotropes, Iresines, Abutilons, etc., all of which should be inserted as the cuttings become available, for it is often possible to gather the tops of the earliest-struck batches to provide further supplies of strong, clean cuttings. Every inch of space should be made use of in the propagating cases during the next few months.

Bulbs in pots

Do not force these unduly, otherwise it will be at the expense of colour both of flower and foliage, and do not permit the growths to drop, but apply small bushy twigs as supports a little in advance of their actual requirement. These are far more desirable for Narcissus, Tulips, Freesias, and similar subjects than stiff wood or metal stakes and ties.

Tomatoes

Sow seeds of proven varieties without delay, small quantities only, as a later sowing is also advisable for the main crop.

Lobelia Cardinalis and its varieties

This plant may now be shaken out, cleaned, and examined for eelworm (its great enemy), and boxed or potted up into a mixture of well-rotted leaf-mould and seasoned turfy loam in equal proportions, with the addition of a little sharp sand or grit, after which the plants should be stood in a cool greenhouse temperature. Seeds of this handsome plant may be sown at the present time in brisk heat.

Orchard fruit trees

It is not always possible or even desirable to give quite the same attention to the pruning of large orchard trees as one is inclined to give to smaller trees inside the garden proper, but reasonable attention must be afforded them if satisfactory results are to follow. Therefore examine such trees now, and where insufficient light is reaching any part of the tree remove the offending branch altogether. A little experience will soon show the worker which to remove, bearing in mind the even balance of his trees, which may be completed after all crossing and superfluous branches have been removed. All large wounds should be trimmed with a sharp knife and coated over with Stockholm tar.

Spraying

Lose no favourable opportunity in bringing forward this work, which should follow the pruning of the trees, and if birds are attacking the buds of bush fruits spray with strong quassia.

Fruits in store

Examine the layers of fruit at frequent intervals, especially where it is necessary to store several layers deep, and thus prevent the infection from spreading to surrounding fruits. Many kinds of Apples are liable to go wrong from this date, therefore remove suspected specimens without hesitation.

Kitchen garden

It is yet too early to sow seeds of any kind in the open, except Broad Beans, a few short rows of which may now be put in to follow those sown in autumn. Wheel manure upon all plots as such become available, and follow it up by trenching or deep digging in order that frosts may penetrate and pulverise heavy soils.

Spring flowers

Stir the soil between these when in a free working condition, and if slugs are troublesome scatter a little soot among the plants.

Scotland

Hardy perennials from seed

While many of these give but indifferent results when raised from seed, there are still quite a number that produce fine, robust, and floriferous plants by this method of increase. The bulk of such may be raised in the open or in cold frames, but I have proved that quicker and more satisfactory results are had when the seeds are sown early in a little heat. By this method the plants are much larger, and so, as a rule, bloom well the second year, many, indeed, actually flowering in the autumn of the year in which they are raised. I will now deal briefly with a few that ought to be sown shortly.

Lupinus polyphyllus

These popular early summer perennials do not come anything like true from seed, but as this method gives fine, strong plants and many variations of colour the raising of a batch of seedlings is very interesting, often very good and distinct shades being obtained. Treat similar to Delphiniums (see page 89) and the bulk of the plants will bloom in the first autumn.

Polyanthus Primrose

Some great improvements have been wrought in these fine spring-flowering subjects, many beautiful shades of colour having been evolved, while the size of both truss and individual bloom have been greatly increased. Many fine strains can now be had, so there is no excuse for anyone growing the old, poor sorts. Like all the Primrose family, germination is somewhat erratic, so it is well to sow rather thinly so that the first-comers may be removed without injuring the weaker and slower ones. These latter, as a
rule, are of finer size, form, and colour t
the others, so not one of the seedlings sh
be thrown away until after it has bloon
By raising these now very fine plants wil
obtained, and these will bloom grandly

New Gladioli

Ir. J. W. Crow, Simcoe, Ontario, akes the following observations of ecial interest to exhibitors of Gladioli the "Canadian Horticulturist":—

MONG new varieties which have so far done well in my own garden is Marmora, a wonderful upstanding ibition variety with seven or eight large ers open, well placed and of a striking shade. The colour is decidedly unusual, the spike as a whole is very impressive. variety is early and comes from Errey of tralia. I am told it is a sport of Emile run, which it closely resembles in connation.

rs. Calvin Coolidge (K) is a beautifully led large Primulinus hybrid, only very htly hooded and exquisite in colour. It cream-pink combination, deep shell pink ling to a soft yellow throat. It was wn last year at the American Gladiolus ibition at Hartford, Conn., for the first e, where it made an immediate hit.

arolus Clusius from Velthuys, Holland, is excellent compact spike with five or six ers open in deep shell-pink colour.

Freesia refracta alba, splendid for forcing

illie, from Mair, Scotland, is tall and ight, with a nicely formed compact spike nauve-pink, with clear white throat. It considerably deeper in tone than Bertie w, which latter has with me this year wn a most unfortunate tendency to streaks splashes of colour.

ing George, also from Mair, gave me a tiful symmetrical spike with nine flowers n at one time in a strong red colour, with rply-defined cream throat.

have had several very fine spikes of Fern e (K), and Betty Joy put out by Gladiolus has been a veritable gem. It is early, shows from six to eight flowers open at time in a most attractive shade of light sh pink.

imrod, from Errey, Australia, comes in an n shade of dark maroon, and has been fine. Wilhelm Pfitzer's Memory is a nt white exhibition flower, with six open ne time. Eugene Lefebvre (Lemoine) is rand flower of very large size, showing a king dark blotch on a rose background. unusual colour combination is Mair's ovely." The colour is true rose-pink, trasting beautifully with the large, pure te centre. The spike is of splendid form, with eight flowers open, and the spacing is extremely good, although the flowers are below medium in size.

AMERICAN SHOW NOTES.—The American Gladiolus Show was staged in the Toledo Armoury August 16th and 17th. The Kunderd exhibit was beautifully set up, and occupied one end of the hall. We have no growers in Canada who are equal to such a display as this, but with this one exception I am sure our Canadian exhibitions would compare most favourably indeed with the American show. To my mind the most striking exhibit was an extensive and magnificent display of W. H. Phipps, staged by P. J. Pentecost, of Tipton, Indiana. I have heard it said Phipps is not easy to grow, and while there may be some truth in this assertion, there is no question of the surpassing beauty of the variety when well grown. Mr. Pentecost's spikes averaged 10 to 12 flowers open, and every spike was straight. I do not recall ever having seen a crooked spike of this vareity. The colour is flesh pink, with a slight shade of delicate salmon. The flowers are large in size, well-arranged on the spike and of exceptional lasting quality. Throughout the show the heat was extreme, but this display showed less wilting and better staying power than any other exhibit in the building. The soft appearance of the flowers is due to the delicacy of colour in combination with a fineness of texture, which is, I believe, rare in Gladiolus.

A Gladiolus show of such magnitude brings together such an immense number of flowers in such a wide range of colours, types, and varieties, that even the most enthusiastic Gladiolus lover is likely to experience some bewilderment. One of the most obvious lessons to be learned is that no such thing exists as a "best" variety. Some are entranced by the bizarre beauty of Louis Hemon; others thrill to the delicacy of form and colour found among the prim hybrids, while still others are most impressed by the immense size of such flowers as Pfitzer's Triumph. It would be easy to find fault, and it must be admitted that few varieties are free from defect of some kind. I asked one of the leading judges if he could show me anywhere in the building his idea of a perfect exhibition spike. His reply was, "I don't think I have seen any." The most serious defect of Gladiolus varieties in general when used as cut flowers is failure to open well after being cut and placed in water. I believe there are really very few sorts which can pass this test, and am inclined to think the slender stemmed varieties fail more seriously in this regard than do those of stout, husky build. Another important point can be scored here for Phipps, which is one of the best in this respect.

Space does not permit a detailed description or criticism of the outstanding varieties at Toledo, and I will close by listing those which appealed most strongly to me. Of the older varieties, the following were extremely well shown and were outstanding:—Rose Mist, Marmora, Mrs. Calvin Coolidge, Evelyn Kirtland, Dr. F. E. Bennett, Minuet, Roi Albert, Rose Ash, Pfitzer's Triumph, Mrs. P. W. Sisson, Scarlet Princeps, Bill's Aristocrat. Among the new varieties the following are some of those outstanding:—Rozan, Miss Des Moines, Jane Addams, Angel's Dream, Liebestraum, Janice, Catherine Edwards, Coryphee, Kirchhoff's New Violet, Marion Louise, Ella Day, and Forest Fire.

Commercial production in the United States of Gladiolus bloom for market has reached very large proportions. There are numerous growers who cut a million or more spikes per year. The following are among the most popular varieties, and it is well to be reminded that these sorts are grown because of their proven all-round dependability. These are not placed in order of merit or popularity. Evelyn Kirtland, America, Mrs. Frank Pendleton, 1910 Rose, Halley, Wilbrinck, Elizabeth Tabor, Le Marechal Foch. It will be a long while before some of the much-heralded new varieties find places in this list, and this thought might well serve as ballast to the good ship "Gladiolus" in its search for the new and unknown.

Freesias in flower

FREESIAS belong to a class of plants often described as Cape bulbs on account of their habitat being the Cape of Good Hope. A genus of the Natural Order Irideæ, of which the following are also members:—Crocus, Gladiolus, Iris, and Ixia. Freesia refracta alba is, perhaps, the best white variety, but there are now many coloured forms and varieties of Freesias possessing distinctive merit. Failures often occur through introducing the bulbs to warmth before they are established. If potted in successive batches throughout the autumn, commencing in August, a supply may be kept up until late in spring. The flowers are deliciously fragrant, lasting a long time when cut and placed in water. The illustration shows a batch of Freesia refracta alba. J. L.

FRUIT GARDEN

The decline of Grape-growing

I THINK there is not the slightest doubt there are many gardeners in England at the present day as capable of turning out first-class Grapes as were their forefathers, and that the decline in Grape-growing is due to other causes, the ever-increasing demand for more and more flowers, and the introduction of many different dessert fruits from abroad. Fifty years ago, when one gardener called on another, probably one of the first visits would be to the vineries; to-day it would more likely be to the Carnation or Orchid houses. In these days, with the call for more flowers, and labour apt to be scarce, other departments may not be so well done, and probably the Grapes, especially the choicer kinds which, as every good gardener knows, require a maximum of care and attention, are the first to suffer. Again, with so many foreign fruits now on the market it probably hardly pays either the private or market grower to grow largely and extra well choice kinds like Muscat of Alexandria and Cannon Hall Muscat, or even the popular Grape of more inferior quality, Gros Colman, all of which require plenty of time and heat to bring them to perfection.

Hardwick. E. BURRELL.

Melons

I was interested in a crop of Melons in a two-light frame in a small garden near here during the months of last summer as an illustration of what can be done with this fruit under such conditions, that is, when artificial heat in houses and pits is not available. Of course, the summer of 1928 was an exceptional one, and the grower had paid every attention to his plants, utilising all available sun-heat and keeping the foliage clean and healthy, with careful watering and syringing, and free from one of the Melon's greatest enemies, Red Spider. Fourteen fruits were cut from this two-light frame, not large but fair-sized, well-ripened fruit. The variety was the old Hero of Lockinge, one of the best to use under such conditions. I have often thought it would be interesting to try the Melon that Burnaby found growing so extensively in Khiva and which he found "more delicious than anything he had tasted in England," although the size of the fruit he received as a present (25 lbs.) would seem to savour of the Water Melon type.

Hardwick. E. BURRELL.

VEGETABLES

Garden Peas: The first and last dish

MOST folks who grow garden Peas are interested in securing the earliest crop, and by common consent rely on dwarf approved sorts. There are many varieties today that can be depended upon, and it behoves all who would have first pickings to at once prepare ground in some sheltered position. In this connection it is wise to take advantage of a south wall border, as there one may reasonably look to gather the first baskets. Well-trenched and well-manured ground supplemented with a good dressing of lime, supposing the soil to be deficient in that constituent, should be provided, and one or two sowings made at intervals during February and March. We may have our own particular sorts that have served us well in the past, some of them possibly old ones like William Hurst and American Wonder; but, good as these are, it is well sometimes to deviate from hard-and-fast rules and try other and more modern varieties. Personally, I have had excellent results with Sutton's Pioneer and Little Marvel. They are both very early, dwarf, and splendid croppers, seldom exceeding more than about 2 feet in height, and only needing small sticks by way of support.

EARLY PEAS FOR LATE CROPPING.—It is not always appreciated that, as a general rule, more success follows the sowing of seed of dwarf sorts for a late crop than when tall varieties are grown. We have on many occasions had dishes of Peas the last week in October from dwarf sorts sown the first week in June. It cannot be too strongly emphasized that the best results are achieved when thought is given to the best situation for late croppers. An open, sunny situation or a sheltered border, but away from trees or tall-growing things, like Runner Beans, that impede light, ought to be reserved, and seed should be sown not later than the first week in June, or even a little earlier. There is, of course, an element of risk with late Peas, so much depending on the state of the weather, but we are up against this even with early crops of other vegetables, but the risk is worth running, considering the value of Peas on the table.

Several times I have been able to gather my last basket as late as the first week in November when grown on a wall border—to the surprise of the credulous—and in view of the small cost of seed I have no hesitation in saying that "the game is certainly worth the candle." It ought never to be lost sight of that dwarf Peas, obviously, mature sooner than tall-growing sorts, hence their value for late sowing.

W. F.

Report on condition of horticultural crops on January 31st

Beet.—Roots keeping well on the whole; good supplies still available.

Broccoli (Spring Hearting). — Foliage damaged by the severe weather, but prospects are still fairly promising. In Cornwall the main crop, Roscoff Broccoli, has suffered no more damage than other varieties.

Broccoli (Sprouting).—Average genera

Cabbage (autumn-planted).—Some s damage by frost this month.

Kale (Green).—Satisfactory.

Leeks.—Average.

Parsnips.—Roots good and plentiful.

Rhubarb (forced).—Good quality s now being marketed. Yorkshire crop ported to be average, whilst in Cheshire crop is reported to be exceptionally good

Seakale (forced).—Forced well in Mi sex, and good, clean stalks being marke

Anemones.—Severely damaged by weather, but prospects of a fair cro Fulgens in Scilly Isles.

Daffodils and Narcissi (indoor).—G though late, in Scilly Isles; in Corn blooms not so plentiful as last year; ave in Lincs.

Daffodils and Narcissi (outdoor).—B ward; good in Scilly Isles, though Tru varieties will probably be below average.

Hyacinths (forced).—Average.

Tulips (forced).—Average.

Violets.—Damaged by frost in Cornw promising in Home Counties.

Wallflowers.—Plants good and pro well.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plant be named should send fair examples of each— stem, leaf, flower, or fruit. (Snippets of le and points of shoots are useless.) Not more four plants should be sent in any one week by same correspondent. Where more than one is sent they should be numbered. Of conifers cones should always be sent.*

Naming fruit—*Several specimens in diffe stages of colour and size of the same kind gre assist in its determination. Single, unripe, deformed specimens are difficult to name. do not undertake to name more than varieties at one time.*

FRUIT

Diseased Strawberry plants

(F. E. F.).—Your Strawberry plants are affected with a foot rot, and the fungus concerned has attacked most of the roots and destroyed them. We are afraid that the plants actually affected are beyond hope of recovery, but it would be a wise precaution if the whole batch of plants were given a thorough soaking with a solution of Cheshunt Compound. This solution will not cure attacked plants, but will prevent healthy plants from being attacked. After using the Cheshunt solution, and the plants are ready for water again give them a soaking with a solution made by adding 1 oz. of sulphate of potash to 3 gallons of water. Repeat this in a week's time. Cheshunt Compound can be bought from many horticultural sundriesmen and is often advertised in our columns. The compound only needs dilution with water to be ready for use. Another year you would be wise to add sulphate of potash to your potting soil prior to putting your Strawberries into their final pots, or it might be applied in the liquid form as indicated above. The plants would winter better if potash was applied during the autumn months.

Apple Scab

(T. E. Bayley).—The specimens sent for examination are badly affected by Apple Scab, which is caused by the fungus Venturia ineaqualis. The control for this disease is to go over the tree at once and remove and burn all dead tissue. Follow this treatment by using a lime sulphur wash at the pink bud stage, *i.e.*, when the flowers are showing colour, but before the petals open. A second spray should be given when all the petals have dropped from the flowers, and a t about three weeks later. It is important the times given for spraying are adhere strictly; a delay of a few days at one of three periods given will mean that the sp of the fungus is considerable. The stre of the first spray should be 1 in 29, the se and third sprays should be 1 in 99.

Strawberry plants

(K. J. Dillon).—It is difficult wit actually examining the plants *in situ* to termine the reason for the failure of Strawberries. We have carefully exam the specimens submitted and can find no of either insect or fungoid trouble, and can only conclude that some cultural d is at fault. Are you certain that the si well drained, because if the soil is w logged at any period of the year the roots killed off and the plants eventually die. failure often occurs in patches, the pl dying in the very badly drained patches, the rest just manage to struggle through winter. We notice that your specimens s signs of having the crowns well out of soil, and as a Strawberry plant throws fresh roots each season, each time fro point higher up than the previous root sometimes happens that the new roots duced fail to reach the soil. If the new r fail to reach the soil the plants gradually The roots of Strawberries should be distu as little as possible. After cropping, the should be cleaned and cultivated at once, every encouragement given to enable the roots which are produced shortly after to a good hold of the soil. In practice this be attained by slightly earthing the plan there is the slightest sign of short roots a soil-level.

ing Pear trees

Anxious Yorkshire Reader).—The time rafting varies a little, according to er the season is a late or early one, and regard to the part of the country in the operation is to be carried out. bly, however, about the middle of will be suitable for your district. As varieties of Pears break into growth early you should secure the scions) at once and heel them in at the north a high wall, it being most important hese be no further advanced in growth he stocks. The latter, too, should be nt, or at least just starting to move.

ats shanking

D. C.).—We are strongly of opinion ou have somewhat spoiled your young by excessive feeding. While old, fruitnes would doubtless have been able to late such an amount of food, it is difwith these youngsters. It also looks you had been rather sparing with the Healthy-growing Vines require a erable quantity, and it is fatal to permit roots getting really dry. A light apon of lime will do no harm, and will likely counteract the overfeeding. We refrain from applying any kind of ser until after the crop is thinned, when ht application of Thomson's Vine re can be given. It is a pity that you ot stick to this old standard material d of the others mentioned. We think he old Hamburghs would benefit by a application of Thomson's at starting and another immediately after the es are thinned. The cow liquid is an unsatisfactory feeding material for es, it being so difficult to know just the r strength at which to use it.

VEGETABLES

sed Potato

Reed).—The Potato specimen sent for nation is affected with Corky Scab, is caused by the organism Spongo- subterranea. This disease is a comone amongst Potatoes and takes two . In mild cases it causes just surface which do little or no harm, except that il becomes infested with the spores of sease and which may set up the trouble more serious form another year. The l form appears when the attack is . Then, instead of producing scabs on rface large canker areas are set up, accompanied by serious malformation ers. As you had only one tuber affected not think you need worry unduly. ce rotation of crops if you can, and planting any tubers showing signs of sease. Flowers of sulphur added to the the rate of $2\frac{1}{2}$ ozs. per square yard s the disease when the intensity of the is sufficient to warrant control.

sip trouble

A. Phillipson).—The specimen sent for nation is affected by the maggot stage rot Fly (Psila rosæ, Fab.). The actual ts were missing, but we are basing our n upon the nature of the damage. This ttacks Carrots, Parsnips, Celery, and y. We do not think that you can do than apply a good soil insecticide, such porite, to the plots that have actually the crops given above. To apply the eal actually to the plots that are going y these crops would not account for sts that are in the pupal stage in the ound the crops that were attacked this . We have found by experience that st time to apply Vaporite for this pur- about the first week in March. The eal should be applied according to the makers' instructions, especially with regard to the amount to be supplied. If you can kill the pupal stage of the Carrot Fly *in situ* it is better than applying control measures during the summer months. As you have had a very serious outbreak you should keep your Parsnips and Carrots dusted with a mixture of creosote and dry soil at intervals through the growing season. This does not kill the maggots, but deters the adult flies from egg-laying. The creosote mixture is made by adding 1 oz. of creosote to 3 lbs. of fine, dry garden soil. This quantity is sufficient for 30 square yards.

Tomato plant failing

(F. E. F.).—Your Tomato plant arrived in such a dried-up condition that it is impossible for us to say what is the cause of the trouble. If you would like to send us another plant packed in a tin box we should be pleased to examine it for you. Soft plants packed in paper and cardboard dry to such an extent in the post that they are useless for examination. All we can say from the material we have is that the root-system of the plant appears sound. When you write again please give us the details of your cultivation, especially the temperature at which the plants are kept by night and day.

GREENHOUSE

Genista fragrans

(G. P.).—Cuttings of this plant will readily root if half-ripened shoots are selected and slipped off with a heel. The cuttings ought to be inserted in a bed of sandy soil in a cold frame and kept close until roots are emitted. Or they may be placed thickly in a pan, which must be covered by a cloche, and struck in the temperature of a cool greenhouse. April or early May is the best time at which to propagate Genista fragrans.

Petunias damping

(G. P.).—As your plants only began to "damp off" when coming into flower, there is more than a likelihood that they were grown in quarters which were too rich. Damping is more customary in the earlier stages; and you might, in future, find it advantageous to omit the manure from your compost. Avoid, too, at all stages, a close, "stuffy" atmosphere. Soft plants like Petunias thrive better if they are freely ventilated. Watering must be carefully done—excess of moisture invariably leading to disaster. If these precautions are observed, it will be unnecessary to use the specifics you mention—unless, of course, you might feel "safer" if you did so. In that event use the remedy exactly according to the directions of the makers.

FLOWER GARDEN

Hyacinths diseased

(R. Parry).—Your specimens have been examined and there are several things present which would account for the failure, but the trouble has proceeded so far that it is almost impossible to say what was the original cause of the trouble. Your best plan would be to write to the firm concerned, sending them a sample of the bulbs as you did to us, and ask them to explain why the bulbs have failed. It appears to us likely that the bulbs were diseased when you received them, and the firm concerned will probably welcome the chance of putting the matter right. We can find no fault with the soil sample, and the bulbs should have grown well in it had they been healthy.

Salvia candelabrum wanted

(L. B. W., Wells).—This South European species is offered by the Primley Botanic Nursery, Paignton, Devon. Plants only are offered.

Helleborus niger

(W. P. P.).—See replies on the same subject in recent issues. It is evident that your Christmas Roses have exhausted the soil in their immediate neighbourhood. After the flowers are over growth will probably make some strides. Lift then, and after having well-enriched the quarter with old, well-rotted manure and leaf-mould, replant the clumps. This ought to renew their vigour, and if the work be well done no further attention ought to be needed for several years. Yes, March would be a suitable time.

TREES AND SHRUBS

Hollies and Rhododendrons

("Newcastle-upon-Tyne").—There can be no doubt but that well-rotted cow manure is the best stimulant for Rhododendrons, and if you can procure it you can get over the unsightliness by covering over with a little loam. (Do not dig it in, the Rhododendron being a surface rooter.) Failing the cow manure, well-rotted horse manure will give very good results used in the same way. We also believe that either of these would be better for the Hollies than any artificial preparation. You can give some to the Hollies without doing any harm, but lime in any form is disliked by Rhododendrons. While a heavy mulch of fallen leaves is good for Rhododendrons, helping to keep the roots cool and moist, there is very little actual nourishment in such, and this would not prove so valuable as the animal manures.

MISCELLANEOUS

Bone-meal

Can I make bone-meal for use in my garden from household bones? If so, how? Will all bones do equally well (flesh, fish, and fowl)? J. N. G.

[We do not think you will be successful in making bone-meal. The process is somewhat as follows:—Bones of all shapes and sizes are collected, clean shank bones are selected for making cutlery handles, hard bones for glue are then sorted out, and the remainder are used for crushed bones. The material selected for crushed bones is steamed at low pressure to remove fat, which, of course, is a valuable by-product. The material is then crushed by machinery and the resulting material sorted out into $\frac{1}{2}$-inch, $\frac{1}{4}$-inch, and bone-meal. Nothing else is added to the materials as sold by the horticultural sundriesmen. Steamed bone flour is the residue from the first and second grade of bone mentioned above. The ends of the bones selected for cutlery are removed, being useless for the purpose. These, together with the bones selected for glue-making, are steamed first to remove fat at low pressure and again at high pressure, this time to remove most of the nitrogenous content, as gelatine or glue. The residue left after the gelatine is removed can be ground into a very fine state of division, and is sold as bone-meal. Enough has been said above to indicate that it is cheaper to buy the manufactured article rather than to make it. The easiest way to make use of home-saved bones would be to burn them, and then the residue is fairly easily crushed with a hammer and the resulting material can then be applied to the soil where phosphate is required. The burning destroys all the nitrogen, but the phosphate is left behind.]

Pearlwort on lawn

I shall be very grateful if you can tell me of anything that will eradicate Pearlwort. Our lawn is full of this weed, and although we have tried all sorts of remedies, such as lawn sand, etc., nothing seems to have any effect.
CATHERINE E. BURD.

[If of the annual variety, the best plan is to prevent the plants seeding by frequent use of the lawn mower, which should be set very low for this purpose. This in time will, naturally, get rid of the pest. If, on the other hand, it is Sagina procumbens, it is very difficult to deal with, as it spreads very rapidly, and we know of nothing to clear it out, short of clearing off the turf where the weed is flourishing and relaying with clean, fresh turf.]

Lime wash

(Kincardin).—A good lime wash for cleaning Lichen and Moss from fruit trees can be made by taking 10 lbs. of good lump quicklime and adding 10 gallons of water. If you are not sure as to the quality of the lime 15 lbs. might, perhaps, be used. The method of mixing should be to add just enough water to cover the lime while it is slaking. When slaked the mixture should be thoroughly stirred and then made up to 10 gallons, again stirring. The resulting lime wash should be carefully strained before placing into the sprayer, and the wash should be applied as thick as can conveniently be sprayed. This lime wash would answer both for Gooseberries and Red Currants, and should be applied just before the buds begin to move.

Lime

(T. E. Bayley).—From your description of the soil it would appear likely that chalk (calcium carbonate) would be the best form of "lime" to apply to your garden. This material should be applied at the rate of 1 lb. per square yard, and the earlier you can make the application the better. If you would like to send us a small sample of the soil concerned we should be in a better position to inform you as to the amount required, but the amount given above should be enough unless the soil is very acid in character.

SHORT REPLY

(A. J. C.).—We have frequently seen Sweet Peas trained on large-mesh wire-netting, and never heard that the plants did anything but well on such supports.

NAME OF FRUIT

C. S.—Pear Catillac. The sample is medium. Much finer fruits are being sent to Covent Garden at the present time. It is the best of stewing Pears, cooking a deep red.

BEES

Candy feeding—warm quilts to assist brood rearing

GIVEN normal conditions, February is the month when activity within the hive commences in real earnest. The queen is now beginning to lay, and it is of vital importance that there be sufficient food for the demands of the rapidly increasing larvæ. Had the colonies enough food (30 lbs. is none too much for an average stock) when the bees were packed down last autumn is the question which the bee-keeper must ask himself. If there is any doubt a cake of soft candy should be at once placed over the centre of the cluster. This operation must be performed with as little disturbance as possible. The candy can be placed over the hole in the bottom quilt without exposing the frames to the cold air for more than a few seconds. Bees should not be fed with syrup before the beginning of March, and then only if the weather is sufficiently warm for them to fly. From now until then candy is the only safe method of supplying food. It must not be thought from the above remarks that I *recommend* candy feeding, but if last autumn the bee-keeper was not far-sighted enough to supply his colonies with sufficient food, candy now may save them from starvation.

On no account should any attempt be made to examine the combs for some weeks to come; only harm can result by disturbing the bees in cold weather. Too early manipulation has caused the death of many a colony.

It is an advantage to give additional warm quilts at this time of year; everything that increases the internal warmth of the hive helps on brood-rearing. The more young bees we have in March the better.

One frequently notices that during the early part of the year a number of bees lose their lives owing to the moisture on the smooth alighting-boards. A bee on its return to the hive often falls over on its back and, owing to the wet, its wings become fixed to the board. The poor insect struggles for a short time, but in nine cases out of ten she fails to right herself and soon dies of cold.

These casualties can be avoided if, when painting the hives, the alighting-boards are sprinkled with coarse sand whilst the paint is still wet. The roughness caused thereby prevents the bees' wings adhering to the wood. Bees are valuable in spring, and we should do everything to prevent untimely deaths.

As a temporary measure a strip of canvas or unbleached calico can be stretched flat along the alighting-board and kept in position by means of drawing-pins. Most hives would be improved if the alighting-boards were made with a greater slope.

Wells. L. BIGG-WITHER.

The work of Sir Jagadis Chunder Bose

CHANGE is the most universal phenomenon of the world. It is the necessary characteristic of the existence of anything—that it must change. And under this inexorable law beliefs and ideas, among other things, are being constantly remodelled; a scientific doctrine of accepted infallibility may in 10 years be relegated to the scrap heap of discarded beliefs. The sciences of chemistry, physics, zoology, and many others, they have all borne witness to such cataclysmic changes, and now we may be witnessing the incipient stages of just such another. Sir Jagadis Chunder Bose, indeed, may be acting the *rôle* of iconoclast in the biological sciences. In a previous review published in this journal I said: "Hitherto the absence of nervous and muscular systems has been held to be a distinguishing characteristic of the plant kingdom. If Dr. Bose is justified in the conclusions he has drawn from his experiments then this distinction becomes non-existent."

Whether the consummation of Sir Jagadis' beliefs will be achieved in general acceptance depends largely, it seems, on the accuracy of his experimental technique, and the central factor in this query must, of course, be his instruments. An independent opinion formed from descriptions is, of course, impossible, the only reliable judgment must be that based upon actual inspection. The layman, however, may find some assurance in the favourable opinion of many eminent men of science, as witness, for example, the Committee of Fellows of the Royal Society, which included Sir William Bragg and the late Sir William Bayliss. Again, lately, Professor Molisch, of Vienna, has obtained completely satisfactory results with the use of some of Bose's instruments. Such confirmations undoubtedly enhance for the general public the importance attached to Bose's suggestions. The significance of the intensification of belief in such a creed—for it amounts to nothing less—is considerable, because it teaches more than a mere re-orientation of outlook on processes such as photosy or the ascent of sap—it teaches the doctrine of the universality of things. however, we must eschew all ethic cussions and confine ourselves to mor dane, but no less important, conside such as the modifications the new ide effect in the practice of horticulture.

The books of Sir Jagadis make, in particular appeal to the horticultur cause there are in the garden unique tunities of observing the phenomen which they deal. We read in "Plan graphs and their Revelations" that Dr. Bose's chief aims is to support tion of knowledge by "the greatest and civic diffusion of it," and it is end we suppose that he has written list of books, to which he has just ad another. The latest volume of the "The Motor Mechanism of Plants," some ways an amplification of vie pressed in a previous smaller volum the reader acquainted with the ele scientific terms this volume should pr fund of unrivalled interest.

"The exhibition of contractilit irritability, obvious in the case of th motory animal, is so much less so sessile plant that, beyond the exc sensitivity and movements of sensitive it has been tacitly assumed that pl general are neither excitable nor cap movement. This is the matter special with in the several chapters of this ("The Motor Mechanism of Plants")

Consider the early stages of the ev ary process. The earliest specimens would not be unlike some of the pres members of the Phylum Protozoa. undifferentiated masses of protoplasm respond to stimulation at one point c bodies by movement in another part, t hibiting both contractility and condu And, the contractile vacuole may b to embody the origins of rhythmicity. such organisms both plants and a arose. In the animals tissues differentiated to perform a single fu The muscle became the organ of co lity and the nerve that of conductivit any such division take place in Possibly. There is in the plant, accor Dr. Bose, "nervous" tissue and cor "muscle" tissue, but "the differenti the tissues has never reached in th series anything like the same degre the animal series."

Nevertheless, both tissues are the they give the same outward manifest their activity as those with which familiar in the animal. Movement animal is the characteristic effect activity of muscle. Is such, also, the the plant, as, for example, in pudica? The older explanation of of the Mimosa leaf seems to have b excitation caused an expulsion of s the cells of the pulvinus with conseq crease of turgor, the leaf falling by its own weight. Bose has shown, h that if the leaf is stimulated while t is upside down the former rises aga force of gravity, thus suggesting t normal fall is due to physiological tion of the protoplasm, accompanie crease of turgor. Other reactions d by Dr. Bose lend weight to the view fall of the leaf of Mimosa is the resu activity of a tissue that may not priately be called muscle, the latt situate in the pulvinus. The an structure of the pulvinus is suggesti vascular strands of the petiole con

LAWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS'
LAWN GUANO
(A Compound Fertilizer)

he safest dressing for turf. It feeds the turf over a long period and will not burn discolour the grass. Lawn Guano quickly strengthens the roots and encourages dense growth of fine grass. As used by important clubs and municipalities. Apply ow at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.
Prices, in Bags: 7 lbs., **3/-**; 14 lbs., **5/-**; 28 lbs., **9/-**; 56 lbs., **15/-**
1 cwt., **25/-**. Carriage paid.

FISONS'
BASE FERTILIZER

hould be incorporated with the soil before sowing grass seed. Specially prepared promote strong root growth and give new grass a good start. Use 4 ozs. to the . yd. a few days before sowing the seed.
Prices, in Bags: 7 lbs., **3/-**; 14 lbs., **4/6**; 28 lbs., **7/6**; 56 lbs., **12/6**;
1 cwt., **20/**. Carriage paid.

FISONS'
LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed, such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.
Prices, in Kegs: 14 lbs., **5/-**; 28 lbs., **9/-**; 56 lbs., **16/-**;
1 cwt., **27/6.** Carriage paid

FISONS'
GRASS SEEDS

are the finest procurable, being specially tested before selection.
Special Mixture (for Bowling and Golf Greens, finest grasses only).
Prices, in Bags: 7 lbs., **15/6**; 14 lbs., **30/-**; 28 lbs., **58/-**; 56 lbs., **110/-**;
1 cwt., **210/-**. Carriage paid.

'Phone: Syd. 1268. SHOWYARD OVER QUARTER MILE LONG Established 75 years.

the pulvinus into a central core which is surrounded by a mass of cortex, whose behaviour to double staining is remarkable. With hæmatoxylin and safranine developer the cortex tissue in the lower half of the pulvinus becomes stained an intense red, and only a few scattered cells in the upper half become so deeply stained, the inference being the cells of the lower half of the pulvinus contain an active substance which is readily stainable. Incidentally, the cells of active animal muscle are of an opaque, granular nature. The significance of the paucity of deeply stained cells in the upper half of the pulvinus is that the upper half of the pulvinus is less active than the lower, and thus it is only under certain abnormal conditions that the contraction of these cells is manifested by upward movement. It is interesting to note that the cells in inactive muscle tissue contain no granular sarcoplasm.

R. Brown.

Salisbury and District Gardeners' Mutual Improvement Society

At the White Hart Hotel, Salisbury, on Wednesday evening, January 23rd, members and friends of the above Society filled the Lecture Room to overflowing to welcome Miss Barbara Gullick, B.Sc., a well-known lecturer in south and south-west England on the British flora, and the Chairman, Mr. S. W. Tucker, in introducing the lecturer, said it was not surprising to see so large an audience, as they had in mind Miss Gullick's lecture on wild flowers last year, from which evolved the scheme taken up by the City Corporation, and which created considerable interest throughout the district.

The title of the lecture was "The Making of the Plant World of To-day." The lecturer considered the progress made by plants from a time previous to the formation of coal, through the age of the giant reptiles, to the earliest flower, which was already evolved before the chalk was laid down. (Attention was called to the present-day survivors of types once dominant over the whole earth, as well as to certain links in the chain of progress, which have now become extinct.) After an outline on the mechanism of evolution the lecturer showed slides suggesting the more recently advanced theories accounting for the rise of new forms in plants, leading to the conclusion that a great future for gardening lies in close observation and intelligent plant-breeding.

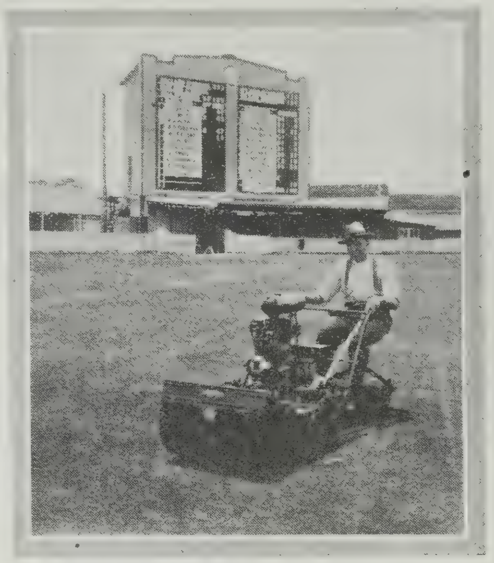
Animated discussion followed, particularly on the remarkable acceleration of the rise of new forms, caused by the help of man in comparison with Nature unassisted, who has Eternity in which to experiment.

Mr. J. Pinder, in proposing a vote of thanks to the lecturer, mentioned how very much the Society was indebted to her for such an intellectual discourse. He was of the opinion that if the younger generation of gardeners would interest themselves more in the scientific side of horticulture it would, in due time, benefit mankind in general.

The British Delphinium Society

Marchioness of Londonderry elected President

The British Delphinium Society held its first general meeting on Tuesday, January 29th, at the Royal Horticultural Society's old hall, Westminster. The meeting was well attended. Mr. C. F. Langdon was in the chair. In the course of his remarks he expressed great satisfaction in the rapid strides the Society had made in so short a time. The election of a President was next proceeded with. Mr. G. F. Berney in a few well-chosen remarks said that the Society had been most fortunate in securing the consent of the Marchioness of Londonderry to become its first President, and he had very much pleasure in proposing Her Ladyship as head of the Society. Mr. G. A. Phillips seconded this proposition, which was carried with acclamation. The Hon. Secretary next made a statement regarding the affairs of the Society. He reminded those present that only four months ago (on September 27th last) the Delphinium Society was inaugurated, consequently there was no annual report or balance-sheet to be presented, but he proposed to outline briefly what has so far been done and what is proposed to be done this year. He went on to say that in this short period the Society has been got well on to its feet, and has already a membership of over 100, which number is being added to daily. The Society has become affiliated to the Royal Horticultural Society, and has fixed its first summer show for July 5th. The Show Sub-Committee have got out a comprehensive schedule which will be posted out to members within the next few weeks. Already a large number of cups and medals have been promised to be competed for at the show. The work of compiling a Register of recognised named varieties of Delphiniums is now under way.



An "Atco" 24-inch motor mower preparing the ground for the First Test Match at the Oval, Brisbane

The excellent condition of the ground was generally commented upon

A statement was next read from the Hon. Treasurer, which showed that the Society is on a sound footing.

The election of officers was proceeded with next. Mr. G. D. Gold was re-elected Hon. Treasurer, Mr. S. Halford Roberts and Mr. A. J. Moir, Hon. Secretary and Assistant Hon. Secretary respectively. The Committee was re-elected *en bloc*, with the addition of Mr. J. Kelway.

Mr. G. Sandercombe and Mr. W. Hitch were elected Hon. Auditors to the Society.

The meeting terminated with a hearty vote of thanks to the Chairman, Mr. C. F. Langdon.

Manchester and North of England Orchid Society

At the meeting held at Houldsworth Hall, 90, Deansgate, Manchester, on Friday, February 1st, 1929, the members of Committee present were:—Messrs. Hy. Astley Bell (in the chair), A. Burns, A. Coningsby, J. Evans, D. McLeod, W. J. Morgan, a Arthur (Secretary).

AWARDS OF MERIT

Cypripedium Helsa Var. Ingrid (Hel x Satyr), a fine flower showing good ev of the Bellatulum parent, from Mrs. and Miss Wrigley. Oncidium tig Towneley Grove Var., from J. B. Ada Esq.

CULTURAL CERTIFICATE

Mr. A. Burns for fine example Platycinis uncata.

GROUPS, ETC.

J. B. Adamson, Esq., Blackpool (gar Mr. J. Howes), staged a group to wh large Silver-gilt Medal was aw Cypripediums in variety, including Worsley, Commodore, Forest King, schildianum, Pyramus, Mem. F. M. O Alabaster, Mrs. F. Sander, Roundhea Desdemona Haddon House Var., B Cattleya British Queen Var. Levi Sophro Lælia-Cattleya Vulcan, On Forbesii, and others.

Mrs. Bruce and Miss Wrigley, Bury dener, Mr. A. Burns), were awarded a Silver Medal for a group. Cypripe Carola, Invincible, Archie Neill, Minos Youngii, Armistice II., Mem. Ogilvie, Obleisk, Morning, and others Pleione humilis.

Mr. John Evans, Colwyn Bay, Cymbidiums Coningsbyanum and Sc Cypripedium Perseus Var., and fine drobium seedlings of the Lady Colman

Messrs. A. J. Keeling and Sons, Bra staged Cypripediums Olympus The man, Fantasiæ, Macie, and Pyramus Charm.

Mr. D. McLeod, Chorlton-cum-H staged Cypripediums in variety.

We regret to record the death of S Gratrix, Esq., one of the founders an long supporters of the Society; a mo thusiastic lover of Orchids.

The next meeting will be held at quarters on Friday, the 15th inst.

Colas modernises Drives and Paths!

MOUNT BRAISWICK COLCHESTER
(Photograph by courtesy of Mrs. Biddulph.)

Motor traffic demands a firm, lasting surface. COLAS supplies this demand.

COLAS—pure bitumen in fluid form—arrives *ready to apply* and can be put down by anyone at any time of the year, without skill or special apparatus.

COLAS provides the Perfect Surface for Drives and Paths at a low initial cost.

One drum, containing 30 gallons, costing 40/-, delivered direct to destination within the Railway Company's free delivery area, will cover approximately 100 sq. yards of gravel drive or path. A considerable reduction is offered if two or more drums are ordered.

Write to Estates (K) Dept. for descriptive leaflet and prices.

Where
can I obtain?

THE difficulty of not knowing exactly where you can secure some special line needed for the garden — probably recommended or seen elsewhere—is easily overcome by utilising the services of "G.I."

Considerable care over a number of years has been given to tabulating information on all aspects of gardening that shall prove of assistance to our readers.

Write us, therefore, when you want to know where to obtain any seeds, plants, shrubs, horticultural implements, sundries, or other accessories to the garden that you do not see advertised in our pages.

Address your enquiry, with stamped envelope for reply, to—

The Manager,

Rose Species

THE beauty of these is becoming more appreciated, and we have collected most of the best and can still offer the following:—Rosa Hugonis, Macrophylla, Beggeriana, Altaica, Amurensis, Cinnamonea, Carolina, and others at 2/6 each.

The rare Duponti (3/6) and the yellow Scotch Rose (Spinosissima) are worthy of notice and are all described in our Catalogue.

The Country Garden

WHERE is greater interest taken in e development and beautification of ardens than in this country. The hman is a lover of his home, and his aste is the result of centuries of culture. ally speaking, this has enabled him to what is good, and so develop in a way his demesne.

hese days they are generally of smaller than of old, but there is more beauty ign and care in their making that was lacking in the of olden days.

secret of success both in planan estate and ing the gar is the proper tion and rehip of the parts; harand fitness everywhere Tastes, it is vary greatly, lmost everyone a garden, large all, therefore it be their amto make the ndings as suitnd beautiful as e.

centuries these bits of old d have been about by of our best . Cowley was ly a poet, but d gardener as and Evelyn, ne, Pope, Miller, and all loved to bout gardens. ey's garden at uth, North was an enting place. on had a great dge of garnd their flower occupants, and also ed wild flowers with a peculiar and devotion. He remembered, loved, sited the gardens of the few people he admitted to his inner friendship, house without a garden seemed to him ossible of civilised residence as a d.

e is a host of noted old-time men of who were renowned for gardenor garden-loving, in which each and piced. Many were diverse in their modes of thought, yet they were filled with the love of gardens, making one think how true are the words, a touch of Nature makes the whole world akin.

Those who live in the country can make the attempt to maintain the characteristics of some of the old and charming English gardens. If the garden about to be laid out has a few full-grown trees it is astonishing how soon they will put off its newly planted appearance. A few of the trees that help to make a characteristic country garden are the weeping trees. These are always picturesque and possess an unique charm in the garden scape. The most common variety of this form of tree is the Weeping Ash, which has much to commend it. The Weeping Beech, with its beautiful and dense canopy of foliage, is very striking, but perhaps the most characteristic tree is the Weeping Willow. This, however, should never be planted where it is likely to suffer for want of moisture. If the garden has a stream running through it, then a Weeping Willow on its bank is an ideal spot for it, and will form quite a feature of the garden.

Besides those mentioned there are weeping Birches and Elms, both being delightful subjects, and, even when bare of leaves, are very picturesque. Before leaving the subject of trees, however, some mention must be made of those trees that are so closely associated with our old English country gardens.

The old Cedar of Lebanon in the Rectory Garden, Childrey, Berkshire

The Mulberry was always a great favourite, with its almost always crooked stem, which adds so much to its beauty. It is generally associated with the lawn. In the autumn it is very beautiful, the foliage turning to a pale lemon hue.

Among the smaller trees the Medlar and Quince should find a place in this old English country garden. With all their beauty how seldom do we find these trees planted in these days. It is a matter for much regret, for they are, indeed, beautiful features, wherever planted, at any season of the year.

In this country garden there cannot be too many flowers, as these add greatly to the charm and enjoyment, especially if flower borders surround the vegetable plots as in olden days. Such borders should be planted with many of the well-known perennials, those perhaps that are not quite showy enough for the more prominent borders in the garden, but yet at the same time have a charm quite their own.

To wander down the long paths in summer with borders of flowers on either side, fruit trees between the flowers, Peas, or Cabbages will be a keen delight.

In the gardens of olden times Yew hedges were always a great feature, giving protection to the more tender inhabitants of the garden, but at the same time these hungry hedges extracted much nourishment from the soil, so what the plants gained in one way they lost in another. By this we do not mean to infer by any means they are to be ignored, but they must not be over-done.

Another very charming feature in most of the olden-time gardens was the sunk lawn, some 3 feet below the level, giving the garden a lovely and quaint appearance very charming to behold. Such lawns, however, must be well drained, and should not be made on soils naturally wet and cold.

In the country garden climbing plants must not be forgotten, making a free use of these on the house, outhouses, and sheds. Most of them grow freely, adding considerable beauty to the garden. Some are also very delightful when used in large beds. For instance, the Clematis produces a fine effect when planted in a large bed with an Ivy edging.

If the main portion of the garden consists of perennial borders a few formal Box-edged beds with their quaint, trim air will give just that touch of formality that all old gardens possessed.

No garden is complete without its wild portion, where not only some of our own wildings will find a place, but also those from other lands. Those who are imbued with the true spirit of gardening will choose the right subjects, and it is worth the trouble to study this portion of the garden and to give each subject its most suitable position.

In these days of high taxation and expenses the tendency is for smaller and less extensive grounds. On the whole, there is much to be said in favour of these compact estates. Many are owned by men who are away for a considerable period of their time, and, if properly managed, they are a source of real pleasure and relaxation instead, as is often the case with larger places, an anxiety and tax upon the leisure of their owners.

Saxifraga lingulata lantoscana associates beautifully with Ramondias on rock w
and produces dense sprays of snow white flowers

Native of Maritime Alps

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Idle thoughts on alpines

HAVING probably completed the winter fireside jobs of making out new seed lists, bringing up to date the gardening scrap-book, card indexing the stock of plants, and preparing next season's log book, and having consoled ourselves that the frost and snow are helping along the pans of Alpine seeds, there is time to look round and speculate on one or two questions relative to rock garden plants before we are again busy among them.

In that comprehensive book on Heaths, "The Low Road," the desirability of striking cuttings in soil taken from near the roots of grown plants is insisted on, owing to the presence of certain bacteria in such soil which will assist the cuttings to root.

It is also believed to be an established fact that in Nature Gentians are more or less inclined to associate for mutual benefit with a microscopic root fungus.

These theories, however, are as yet beyond the sphere of the average amateur, and must
be left to the specialist and the scienti
elaborate. Probably there is most val
data already available on the subject, a
would be extraordinarily interesting to
the progress made and the possibiliti
application.

Success in growing many of the most
cult Alpines is still in the lap of the gods
we are often at a loss to explain our succ
and failures. Like the competitor in
who exclaimed: "Quamquam O ——.
superant quibus hoc, Neptune, dedisti,
can only hope to win through.

Is the secret of success in the laborato

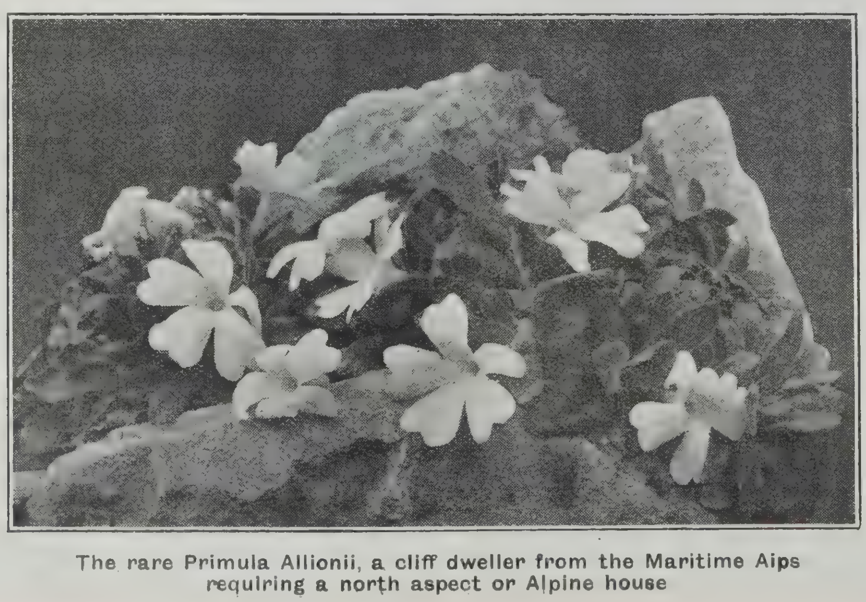
Take for example the case of our g
plant, the Gentianella; unless its failu
flower in certain soils can be accounte
by lack of iron in the soil, as suggest
the R.H.S. Journal, when we fail w
have no remedy but to continue to i
soil from gardens where this Gentian
flower, but may speculate that one da
haps science will discover the cause c
plant's fickleness lies in the absence o
tain microscopic organisms in the soil
that tubes of bacteria will be availabl
supplied by enterprising nurserymen
each order of the plant to assure succ
culture.

Then there is another question of int
the longevity of Alpine plants. It is
bly stated that in the one station
Primula Allioni grows, dead, withere
sules will be found on aged plants far
on the trunk, that may have been co
porary with George III.

With the introduction of Asiatic Pri
perhaps some have come subconsciou
look on the genus as short-lived. In g
where one constantly divides up one's
for friends an individual plant loses its
tity, but possibly many small Alpines i
natural surroundings outlive man's a
span, and other readers may be able t
some interesting examples.

If we plant trees to commemorate e
why not as an alternative let the ga
plant flowers, and lay down, shall we
batch of Saxifraga lingulata lantoscan
Ramondias. They would in future
give more pleasure than laying down a
of port,

F. H. Fis



The rare Primula Allionii, a cliff dweller from the Maritime Alps requiring a north aspect or Alpine house

Iris unguicularis (stylosa)

appening to be in Torquay last week, I
to have a look at the clumps of this
in the cliff gardens. They were
ally covered in blooms, buds, and spent
ers. One of the 56 gardeners employed
e town chanced to come by, and I asked
what treatment was meted to the plants,
he replied that every autumn the foliage
cut right down. I think this should
the question once and for all.

nsford, Exeter. Edward Cahen.

— I was interested in reading the letter
. Burton (Hildenborough) in your issue
ebruary 2nd. I have a great many clumps
is Iris—three clumps on the wall of my
e facing south and also four large
ps on a border in my kitchen garden
g south-west. This year they have
ered continually from the end of October
are still going on. Of course, during
evere frost they ceased for a short time,
ather, the buds did not expand, as they
rost-bitten, but after three or four mild
they started again. I pick two or
dozen a day. They are a perfect sight
e rooms when they open. I tried, two
ree years ago, cutting down the leaves
ne clump in the summer, and they did
ng that year, whereas the other clumps
h were left untouched had no end of
ns, so what is to be said? They do not
r so well two years running. Last year
d not nearly so many, but I put it down
e cold summer we had had previously.
o have one clump of a white one, but it
t nearly so free-flowering, and the clump
seems to increase, although this year
ve picked several blooms.

mouth. J. L. Hawker.

— I have been greatly interested by the
in your pages on Iris unguicularis, and
all provide interesting suggestions.
ng had the care and management of
beautiful Iris for 14 years I venture to
attention to a few practical points of
est to your readers.

acefully poised on what looks like a bare
6 inches or more long, but is really a
nged tube connecting the ovary, which
the ground, with the flower, the delicate
s are worth close examination. It seems
richly powdered with gold, and through
gnifying-glass it may be seen that the
s of "gold" are imprisoned in minute
al globes balanced on the tips of tiny
s. Such flowers are too delicate to be
port of our winter weather, and as soon
e buds show colour they should be cut
brought into the house, where they will
and last for days. Although a stranger
e and snow, the Algerian Iris goes
ely through the trials of an English
er if it is placed and planted with sym-
etic understanding. It is a good ex-
le of the wonderful adaptability of
ts, and though in no sense a decorative
en species, should have a place in every
en where it will be cared for. The
suitable position for this plant is under
ll having a south or west aspect, for it
the very greatest importance that they
catch all the sun from November till
ch, and later on be subjected to the roast-
which seems so essential to the welfare
is Iris family in general.

heavy, cold soil is a cemetery for this
t of Algerian hedgerows and banks, and
ch earth leaves grow rank at the expense
ower. In porous, gritty ground, prefer-
containing lime, the plants flourish
zingly, and, once settled in, usually yield
emingly inexhaustible crop of flowers for
y weeks in the depth of winter. Occa-
ally the harvest is poor, and it seems to
nd more on the heat of the preceding summer than on the actual winter temperature, provided that the latter is not so cold as the present winter.

In normal seasons new plantings may be made in April when the flowers are spent, or in September before growth begins anew after the summer's rest. The rhizomatous roots, which cost but little, should be firmly planted close to the surface of the ground, and when settled in agreeable surroundings plants soon spread into a mat of leaves, by no means at their best in winter, when they are browned and seared, but sheltering the most precious flowers. The plants may be grown fairly close together, and must not be disturbed more often than is absolutely necessary. There is a beautiful white variety, Iris stylosa alba, which will succeed if treated as recommended for the type.

"Copseham," Esher. James A. Paice.

A standard colour chart

I am grateful that your entertaining correspondent, "E. D." (issue February 2nd, page 72), has noticed and sympathetically commented on my letter regarding colour nomenclature, but I must confess to some disappointment, as I hoped that at least she would have welcomed the idea of a standard colour chart.

Narcissus juncifolius, the miniature Rush-leaved Daffodil from the Pyrenees

A sweet-scented little species with rich yellow flowers. Suitable for select spots on rock work
(See page 104)

Her suggestion for introducing ladies into the business of colour description in horticultural catalogues is a good one, but would we get a better conception of colour values? I fear not, and take as my example the catalogue of a famous draper, where all colours are described by a lady. What would we think if we found our catalogues strewn with terms such as mastic, lido, reseda, nil, powder, or some of our favourite flowers described as beige, wine, beaver, flame, mist, nigger, or sand? Some terms would be good if only we know the exact tint meant, such as bois de rose, vieux rose, etc., but, taking them on the whole, the colour terms used by a woman, whilst showing more imagination than those used by men, are even more vague and uncertain than those at present in use.

There is this great difference, however. The draper's lady may call her fabric by any colour term she likes, yet she can still satisfy customers in any part of the country as to the exact colour of the fabric by merely sending them a cutting or sample.

And I think that if a woman did get mixed up with our catalogues and shocked us with extraordinary colour terms she would also sooth us by issuing a colour chart whereby she would make clear exactly what she meant. So, therefore, I now come to agreement with "E. D.," and hope that the lady may soon be introduced into our horticultural colour description business, in the hope that she may be the instrument whereby a standard colour chart will be introduced.

Percy E. Chappell.
Longrock, Cornwall.

The suggested Society of Landscape Architects

I have read with especial interest the correspondence which has appeared in your columns on the above subject, for the formation of a Society of Landscape Architects in this country is a project on which I set my heart many years ago.

On looking carefully into the matter, however, and weighing up my prospects of success, I came to the conclusion that I was proceeding along the wrong lines, and that by far the more feasible project would be the formation of a School of Landscape Architecture and Civic Art, at either Oxford or Cambridge, which would in time and inevitably itself produce both that popular recognition of the profession of landscape architecture and the professional society which we all so much desire.

My reason for this change of policy was shortly that the number of men and women who could claim membership was found, on examination, to be so extremely limited. I venture to doubt whether more than, say, 25 fully qualified and practising landscape architects are working in this country at the present time, though in America the universities are pouring out something like 100 graduates in the art every year, a large proportion of these being young men who seek the support of the A.S.L.A.

What is most extraordinary (I had almost said "pitiable") is that while in America at least seven or eight of the more important universities, including Harvard and Cornell, have strong departments of landscape architecture, and in this country the teaching of the subject is so entirely neglected, *we* have all the best precedent and the finest traditions, and while we neglect this rich and abundant store, America is making the very most of it!

In working out my ideas for a School of Landscape Architecture I received the greatest possible help from the late Viscount Leverhulme and, but for his sudden death, I have little doubt that by now such a school would have been in existence. What is needed is someone with influence and his combination of wealth, common sense, business acumen, and enthusiasm to carry the matter forward from the point at which he dropped it, focussing the interest and activities of all interested.

As I have already indicated, such a school, while eminently worth while for its own sake, would have the further advantage that it would soon render the formation of such a Society as your correspondents envisage both practicable and inevitable. Once founded for the encouragement of the art of landscape architecture, both for its own sake and as a recognised profession, it might exercise great influence on the future development and appreciation of garden design, especially in the provision of those amenities such as public parks, gardens, and open spaces, on the proper provision of which the future progress of our urban populations so largely depends.

Thomas H. Mawson,
Past President, Town Planning Institute.
Lecturer in Landscape Design,
Liverpool University.

—— "Scottish Landscape Gardener" makes a very good point or two and raises questions which need clarifying. First, the term landscape gardener is not completely descriptive of a garden-designer and garden-maker who lays formal gardens, fruit gardens, vegetable and Rose gardens; secondly, it has become generally degraded to describe jobbing gardeners, nurserymen, and contractors who may have no sense of layout, much less of landscape. Garden architect is an international term which is correctly descriptive.

Next, as to qualifications. A man nursery trained and with a good eye for proportion may turn out a splendid garden builder, but he is liable to despise the equally valuable man with culture, architectural knowledge and a faculty for dividing areas into intriguing forms and spaces. These are men like Harold Peto acknowledged to be of the first water who can lay claim to no nursery or garden training; their work speaks for them. The same probably applies to some of our best builders of rock gardens. On the other hand, any amount of training in architecture, draughtsmanship, landscape planting, and nursery work will not make a garden architect out of a mere draughtsman or garden worker.

Chilian Crocus (Tecophilæa cyanocrocus)
Flowers intense pure blue

Ideally, a garden architect should be:—

- From a cultured well-read home.
- Trained as gardener in private service.
- Trained in a nursery.
- Trained in technical horticultural college in botany, chemistry, soils, pathology, etc.
- Trained as draughtsman and architect.
- Have a good knowledge of geology.
- Have actual working landscape experience.
- Have travelled abroad.
- Be natural born gifted.
- Creative and constructive.
- Able to estimate.
- A manager of men.
- Adaptable and diplomatic; and so on.

Who has time to be thoroughly proficient in all these things?

What matters is that the man is able to be the vital force in the construction of a garden. Cut and dried formulas are hopeless in artistic work.

I should suggest that in the early years at least no members should be entitled to use any letters after their names.

There is plenty of good work for a society of enthusiasts to do. Bulldog.

—— I have been reading with interest the various letters on the subject of "Garden Architects," and do feel such a Society would be a great mistake, and, I fear, would do harm for generations to come. I would let the architects attend to their own work and the gardeners their gardens.

It is a great pity to see what might have been a charming garden spoilt by the owner not knowing enough about the making of a garden. In some cases really skilled help is required. It is sad sometimes to see a garden completely spoilt in the laying out. Then, again, do we want too much masonry in the garden? We do not. At times and in some places it is a help. Also steps must be made in some gardens. We need some stones when making a rock garden, but not a portion of a quarry. When a plant-lover visits a rock garden he goes to see the plants and not the stones. It is curious to me that so many people, I am sorry to say, seem to think only of the stones, and not their lovely plants' needs.

With all the wealth of beautiful shrubs and plants we can have for our gardens, why spoil them with too much masonry? If a garden is to give us pleasure we must plant it with care, and try our best to follow Nature as much as possible, so that it gives one a happy, restful feeling. There are, surely, enough bricks and mortar in our houses and towns without filling up our gardens. S. A. M.

Covering bulbs

With reference to the above, from "Inquirer" (issue January 26th, page 54), I very gladly give him my experience with bulbs. I never cover mine with ashes. I pot up about the first week in September, using a good percentage of leaf-mould in compost. A good watering is given each pot and then placed in a cool, dark cellar. I visit them about once a week for the first few weeks, and, when growth is visible, about every other day (in this manner one can very easily pick out any requiring water before coming out I spray both the wa floor with rain-water. "Inquirer" w how much better it is to pick out those have made sufficient growth for rem cold frames grown this way than hav remove a heap of ashes each time pleasant job at the best of times).

I can assure "Inquirer" that I always had good results under these tions, and should he try this method it be interesting to have his opinion.

Near Sunderland. Pip.

Tecophilæa cyanocrocus

THIS somewhat rare plant has, years, occasionally appeared a shows and has never failed to exc miration and interest; a most be spring-flowering bulb from Chili. W wonderful country is this for flow brightest hue! The large Croc flowers are a little variable in the de their blue. Some are dark, some m some light, but all are of real blue, a that ever pleases. A white throat added charm, and a delicate fragra wafted from the blue cups. In the so England and in other mild district lovely little bulb—it is but 6 inches may be grown in the open, exposed sunshine, and planted, in October, in well-drained, sandy loam. In less fa gardens it is, happily, accommodated cold frame, or it may be grown in a embellish the cold greenhouse, and a flowered pan is, indeed, a thing of The Chilian Crocus should be more known. It is one of those little pla rare charm, decided character, and f with deep interest. Ralph E. Arn

The garden in winter

I have been much interested in Sir Lawrence's article, "The Garde Winter," giving a list of shrubs that well and that are actually in season no

How much better these are, surely, few weak, sickly-looking flowers on that should be having their winter sle stead of showing precocity that, I imagine, might weaken the plant for bloom? And I doubt very much if the of very much interest, really, except actual owner of the plants in question.

I should be very grateful if Sir Lawrence would tell me to what Danäe Laurus will grow, and the bes to plant, as I have just the right s which to put it. Betty Sib

Hassocks, Sussex.

This letter has been submitted William Lawrence, who kindly replies

Danäe Laurus is the correct nam Ruscus racemosus of Linnæus. Alexandrian Laurel is a native of Asia and Persia. It will grow up to 4 f height, but is generally much lowe spreads rapidly in heavy soil and shad can be planted either in the autumn March. The leaves, both in Butcher's Broom and Danäe are "cladodes," that is to say, flattened br on which the flowers are borne. In the flowers are terminal and in Ruscus middle of the cladodes. The fact th sprays are not composed of true leaves reason why, when cut, they remain and unaltered for a very long time. has red berries, but does not often fr this country. Seed, however, can be on the Continent or plants can be di This plant ought to be very cheap, doubtless, would be if there were a g demand for it in this country. In two-year-old seedlings are sold, wholes a thousand. It is probably the best iae for mixing with spring flowers, and, ied, with all flowers that are not cut with own foliage.

Anther useful plant similar in appearance d also growing well in deep shade is ccocca. There are a number of varieties a, humilis, ruscifolia, saligna—which t differ very much, the last-named be-, perhaps, the least hardy. Unlike sis, this plant, which is nearly allied to x has true leaves. It produces white, nt flowers in early spring and small it black or crimson according to the iy. It is to be found in many cata-us.

ock gardens at Chelsea Show

his letter in GARDENING ILLUSTRATED of ary 9th Mr. Dillistone refers to a letter nne published in a recent issue, and ap-r to be under the impression that I would h have grey limestone taken from its ay and used anywhere than red sand-. This is not what I meant, as I cer-n consider that the native stone should ilised wherever possible and suitable. e large rock garden to which I have ed limestone appealed to the owners vould not have been obtrusive, as the al rock did not outcrop on or near the hosen. But the cost of the limestone ul have led to the abandonment of the e, and the sandstone has made an ad-le rock garden. Had I to construct a garden in a district in which stone was and unsuitable I would certainly choose one if it could be procured at a reason-ecost. After all, expense is a big con-ition—a crucial one, indeed, with many. difficulty about employing sandstone at ea is the fact that weathered sandstone easily procured, and the unweathered will prevent its employment under circumstances, and, if employed, would ite against its appearance. I think, wer, that one aspect of the question has too much overlooked by writers, ugh, doubtless, in the minds of the ucil of the Royal Horticultural Society. is that these exhibits should be such as of educational value, showing what can ne by the use of various kinds of stone, at those visiting this great show should w best to utilise available material.

"SANDSTONE."

Leptospermums

otice that a contributor speaks of Lep-mum bullatum, L. Scoparium, and L. erum, referring to them all as natives w Zealand; L. lanigerum, however, is ustralian native, but there are other Zealand varieties that make very attrac-shrubs, notably L. Nichollsii and L. manii (shades of pink and crimson), Scoparium (double white, Wilsonii), is, to my mind, both for habit and , the best, and L. Scoparium roseum le). When in England in 1925 at the S. Amateur Show at Vincent Square iced with a very "homey" feeling a iful bunch of "Pink Manuka" (to it our Maori name), so evidently it will all right somewhere in England.

A. E. GRINROD.

kland, New Zealand.

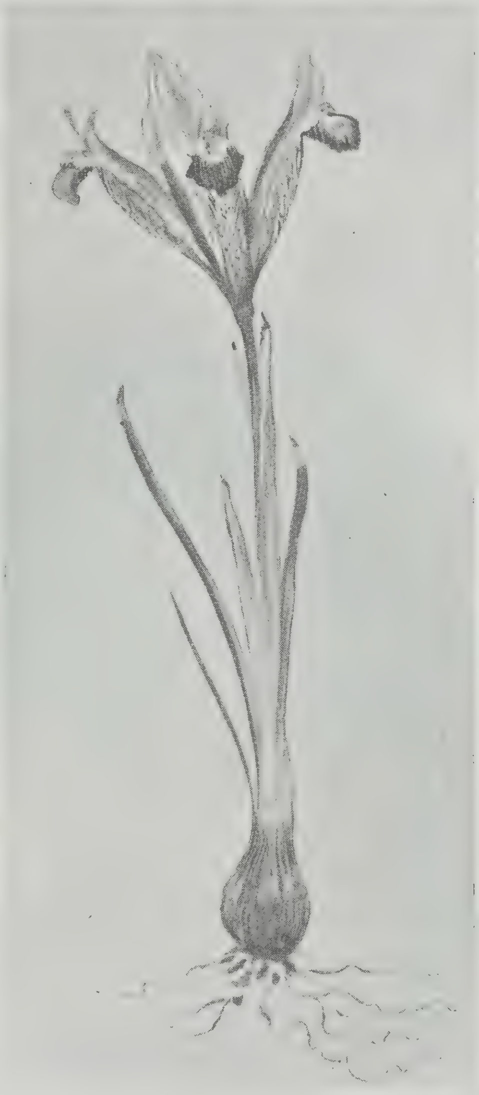
Ceanothus Gloire de Versailles

ave read your note on page 30 of your dated January 12th. It may interest o know that I have successfully grown here for a good many years, in a shrub-bounding a carriage-drive, and it is not protected, and the situation is not high.

ysent House, A. R. VAIZEY.
Boking Braintree, Essex.

Iris Bakeriana

THIS small species is again to be found in the catalogues of firms who specialise in Irises. It hails from Armenia, which for many years has been a closed door, and is evidence that this country is again being visited by collectors. It is one of the first of the spring Irises to bloom with me, resembling the reticulata group, and interesting inasmuch as its leaves are eight-sided in section and not four-sided as are the other members of the reticulata group. It was introduced by Sir Michael Foster 40 years ago from a supply of bulbs sent to him by Dr. Gates (after whom I. Gatesi was named), then stationed in Mardin. Although for gardening purposes it is a reticulata botanically, Foster considered it a distinct species. It was named after Mr. Baker, of Kew.



Iris Bakeriana

There are slight variations in colouring in the arrangement of the falls. My own examples are darker in the falls than the one illustrated in "Genus Iris." Similarly the example in Bot. Mag. table 7084 differs from my own and the Dykes illustration.

It will be observed that the tip of the fall is very dark. This is of an intense violet. The centre space of the fall is white, spotted with deep violet; along the whole length of the haft there is a yellow streak; the sides of the haft bear oblique deep violet veins and dots; the pollen is orange-yellow, very marked in my specimen; standards erect of a soft lavender colour; it is fragrant, which in the warmth resembles scented Violets. The leaves develop as the flowers fade away, when the eight-ribbed leaves may readily be detected.

If we get a change to milder conditions all early flowering Irises will be coming on apace. The next to bloom with me will doubtless be alata, to be followed with the varieties allied to reticulata, histrio, sophenensis, aintabensis, Cantab, and histrioides.

G. P. BAKER.

Truthful catalogues

Col. Wolley-Dod hits the right nail on the head when he suggests (page 38) that "gardeners should see plants growing . . . and not order, haphazard, from a show or catalogue." Just here lies the "danger point" which leads so often to disillusionment and disappointment on the part of the purchaser, and which arises partly from the glowing terms of catalogue descriptions, partly from the impression made by "individual" specimens at shows, and as to the rest from the common habit of the purchaser to take both of these as representative of fact. In truth neither the glowing accounts of catalogues nor the show specimens are representative, in most cases, of the actual general standard of a particular plant as grown in gardens or for commerce. The glowing description aptly describes the selected show specimen, and the latter truly exemplifies the former, but here truth and actuality end. A show specimen may be perfect and the judgment of the purchaser correct in estimating it to be so. Where he fails is in not stopping to consider what culture has been necessary to bring that particular specimen to its perfection, or what degree of trouble to select it from many others. Where the catalogue fails is in hesitating to disclose the secrets of culture necessary to perfection in all those plants which require anything out of the ordinary.

J. R. K.

—— No doubt other nurserymen, like myself, have read the letters of "Clay" and A. H. Wolley Dod (page 38, issue January 19th) with somewhat mixed feelings. Are we to understand nurserymen deliberately deceive by their descriptions, or that they are expected to know what some people would consider to be virtues and others vices, especially in new plants? It may be they make mistakes; but who has not? As an illustration, when Farrer wrote in his book, "The English Rock Garden," that convolvulus althæoides is almost the only trailer of that family to admit to the rock garden, I consider he made quite a mistake. As when established it runs all over the place, and would soon smother every other plant, and as 28 degs. of frost has done it no harm here, it is quite as difficult to exterminate as the wild type, but I do not consider he told a lie, or wrote an untruthful book.

I beg to remind these "Valiants for Truth," that truth is generally symbolised as showing a mirror, and perhaps if they were to look close and deep into her mirror, that even they might not be able to see "truth," but would understand that "what is truth" is still an unanswered question, and also realise that even nurserymen are entitled to a little mercy about their mistakes, and also the importance of the old teaching that mercy and truth should be met together.

Most people quite understand that when a nurseryman spends money to print a catalogue, it is because he is wanting to sell the plants, and not because he is anxious to give away a Botanical Encyclopedia, and moreover, it would not be quite truthful for him to pretend otherwise.

There is no great danger likely to arise because nurserymen employ too much labour, or that people are likely to give them too much of the necessary means to be able to do so. And as a nurseryman, I can assure them, it is not at all difficult to find other people quite willing to worship the money idol, even if it has got feet of clay (I hope they realised this particular idol has also a head of gold), and I consider it is quite possible that some might consider it an inducement, and others an excuse, to do so still more, by the no doubt well meant, but somewhat remarkable feat of "Clay."

Cambridge. A. CASBURN,

Campanula cæspitosa

With reference to Col. A. H. Wolley-Dod's note on Campanula cæspitosa, it is not surprising by any means that such a lot of confusion exists also here, as so many of these gems of Campanulas, like Miranda, have such a cæspitose habit. I have not Campanula cæspitosa myself, but Mr. Reginald Farrer gives a very good, comparative diagnosis of this and other similar species on page 166 of his splendid work, "The English Rock Garden," and which I quote in full, trusting that our Editor can spare the space to publish it.

"The English Rock Garden," by Reginald Farrer, Vol. 1., page 166:—C. cæspitosa (Scop.) has nothing whatever to do with C. Bellardii, C. pusilla (Haenke), C. modesta, C. tyrolensis, C. pumila, or any other of the distinct species which have been shoved under its wing in gardens until all trace of the genuine species has been lost. C. cæspitosa is not a runner, but from one central tap throws up a dense cushion of many serried shoots, thick-set with little narrow-toothed leaves, in no way distinct from those of C. Bellardii, except by their number and density on the far more dense tuft, made up of far more, and more close-packed, barren shoots devoid of runners. But above this mat come shooting wholly different flowers on wholly different stems —tall, very thin, and bare and wiry, attaining as much as a foot, and arching and bending out this way and that, with all the airy grace of Dierama pulcherrimum, beneath the burden of a long, rather one-sided, loose shower of the most lovely hanging bells, delicately strongly ribbed outside, and so pulled-in at the mouth that they look like elongated globules of exquisite clear-blue water, as they waver and sway and tinkle to the slightest wind. It is one of the daintiest of Campanulas, and in the garden answers as perfectly to any ordinary treatment as C. Bellardii itself. In nature it begins far away, so that, perhaps, the long obscurity that has wrapped it may be explained. It can first be seen rather feebly beginning, in the Dolomites, occurring by the roadside between Toblach and Cortina in stony, poor places; but in the Karawanken it is the reigning Bell shaking tall sheaves at the passer-by, from every sandy barren road-cutting, as he crosses the Seeland Pass. In the Dolomites it has to share its home with C. Bellardii, but has not so deep a belt of distribution. In the Karawanken, C. Bellardii is comparatively rarely seen, and then often only at the higher elevations, while C. cæspitosa wholly takes its place and never seems to ascend. It blooms with the other through July to September, and should be best multiplied from seed. It is truly figured, though vilely coloured, and from a specimen of poor stature, in the Ic.Flo.Germ., t. xciv.; and quite lately, in the notice of some correspondent as to some form of the delusive C. "valdensis," the description sounded suspiciously as if it really covered the genuine C. cæspitosa, so long lost in the weltering chaos of C. "pusilla." J. HENRY WATSON, F.E.S.

Withington, Manchester.

Names of Hellebores

In such a charming article as Mr. Cahen's on the Hellebores of our gardens it may seem unnecessary to demand absolute accuracy as to the geographical limits of the species. As the matter is receiving some attention perhaps it may be helpful, for once, to go on a step further.

H. olympicus has not been found in Greece; it was so named by Lindley as it came from the Bithynian Olympus, near Brusa, in Asia Minor. It has not been found on Mount Olympus, in Macedonia.

This may be seen from Lindley's original description of it in the Botanical Register for 1841, Vol. XXVII., Miscellaneous Notices, page 54. He describes it as differing from H. orientalis in having green flowers and no lobes to the segments of the leaves.

The only Helleborus that has been found of late years in Greece is H. cyclophyllus, the finest of all those with green flowers. This was the true black Hellebore of the Greeks, for the Christmas Rose (H. niger), according to Halacsy's "Conspectus Floræ Græcæ," I., page 29, is doubtfully native of Greece.

It has not been collected there during the last century, and the references given by Sibthorp most likely refer to H. cyclophyllus.

This large-flowered species is of a brilliant emerald-green when first the flowers open, and it is a pity it is so seldom seen in English gardens. My plants were collected for me during the war, near Salonica. Sir Arthur Hort writes thus of it in his delightful new book, "The Unconventional Garden":—

"Hellebore, viz., the Greek species, H. cyclophyllus, was esteemed in antiquity as a cure for madness. As it was abundant on the shores of the Gulf of Corinth, especially near Anticyra, it became a common jest to suggest to an eccentric friend that he should 'take a trip to Anticyra,' and Horace calls a hopeless mental case one which 'not three Anticyras could cure.'"

It is good to see "Z.'s" praise of H. fœtidus on page 60. It is so useful to grow where very little else would, and worth looking at all the year round.

The form from the Maritime Alps is even handsomer than our native one. The leaves are more finely cut and have a distinctive red band where they join on to the leaf-stalk. It is also a larger plant.

To make Hellebores last when cut I find it better to pierce the lower portion of stem with a stout pin rather than to crush it, as crushed tissue is more ready to decay.

E. A. BOWLES.

Chincherinchees

A number of letters have appeared in your very interesting journal on the culture of Chincherinchee. I have collected a quantity of seed (white variety) from the veld, and shall be pleased to distribute this to any of your readers who may be interested in the cultivation of these "freakish flowers," as one of your correspondents calls them. Correspondents should enclose an addressed envelope. Only one variety is mentioned by your correspondents. There are quite a number, including a deep orange-coloured one and one of a lighter shade of yellow.

J. T. R. MORRISON.

Pinelands, C.P., South Africa.

Anchusa myosotidiflora

I am obliged to your correspondents (page 2) for their views regarding the cultivation and merits of Anchusa myosotidiflora. One of the most interesting points is the fact that their recommendations respecting cultivation are diametrically opposed to each other. My plants, to which I referred formerly, are not grown in "one of those dry, tidy, weedless English borders," bu
one in a cool, rather wet district, and
border which is never dry, but suits perf
such subjects as Astilbes and other moist
loving subjects. True, the individual flo
of Astilbes are small, as your correspon
says, but the character of the infloresc
is so distinct from that of the Anchusa
there is no common ground for compari
"N. S. C." suggests planting it in
wilder parts of the rock garden, but
might mean that one would have to exc
more desirable plants to make room for
plant, whose leaves are too large, comp
with the flowers. But I shall try it
wet place, and also in my rock garden;
it would give me great pleasure to be
to report favourably upon the results.

AN AMATEUR OF HARDY FLOWE

Daffodils for the rock garden

The article by Mr. Bowles on "Daff
for the Rock Garden" came like a b
of spring, and although there were 4 i
of snow on the ground as I read hi
lightful essay it made one feel that a
spring really is near at hand.

I am trying N. juncifolius nanus in a
garden, and also N. minimus, and hope
by little to find out and be able to proc
few more of the dwarf Daffodils to tr
luck with in sink gardens. F. H.

Hypericum rhodopeum

I once got this species from Suendern
which, I understand, is a sure guarant
accurate naming. It has downy leaves,
trate growth, bright yellow flowers a
as those of Polyphyllum, and is remar
for its early flowering. Last spring, v
in these parts was a season of persi
drought, cold, sunless days and night-f
it grew and flowered without a chec
that its flowers were just going over
Polyphyllum was coming into bud.

Griselinia littoralis

A good hedge shrub

AS a subject for hedge making this
has many excellent qualities, alth
they do not seem to be sufficiently r
nised among those who are responsib
laying down new hedges. I have had n
perience with this Griselinia in norther
tricts, but in the south and west I have
across some very flourishing hedges
from it. The shining evergreen foliag
a pleasing shade of olive-green, and pr
a cheerful appearance throughout the
of the year. The branches are well c
right down to the base, and the old woo
not fail to break when it has been p
back. The leaves are tough and lea
and do not appear to suffer in wind-
situations, and, taking all the above-n
qualities into consideration, this shrub
be regarded as a most desirable shrub f
formation of wind-screens or as a bou
hedge to the garden. Even in shady
tions, under the influence of tall tree
littoralis appears to thrive exceedingly
In ordinary circumstances, this shrub
grow as high as any other hedge su
and planting may be done during Ap
well-manured soil. H. GREAV

Clematis Flammula

I AM surprised to see in last week's
of GARDENING ILLUSTRATED Cle
Flammula described as having little
scent. An arch in my cottage gard
Hampshire is covered with it. On Sept
evenings the air all round is perfumed
most delicious manner. People passin
gate pause to enjoy the scent.

M. A. SPEN

1

2

In Mrs. Graham Wood's garden at Highmount, Guildford, Surrey

5

1, 2, 3. Clematis Flammula over low stone walls and Yew hedge. The agrance of the small, creamy-white flowers in September is variously mpared with the scent of Almonds, Vanilla, and Hawthorn, and is rceptible some yards from the plant. It is a hardy and easily grown ecies, of which there are many varieties.

4. Stone steps, broad, shallow, and of easy tread, leading to grass walk between herbaceous borders.

5. Griselinia littoralis on the left of paved walk near the house. This large evergreen shrub, native of New Zealand, is of rounded habit, has leathery leaves, and is recommended for forming hedges in mild and maritime localities.

The Agapanthus as a Tub Plant

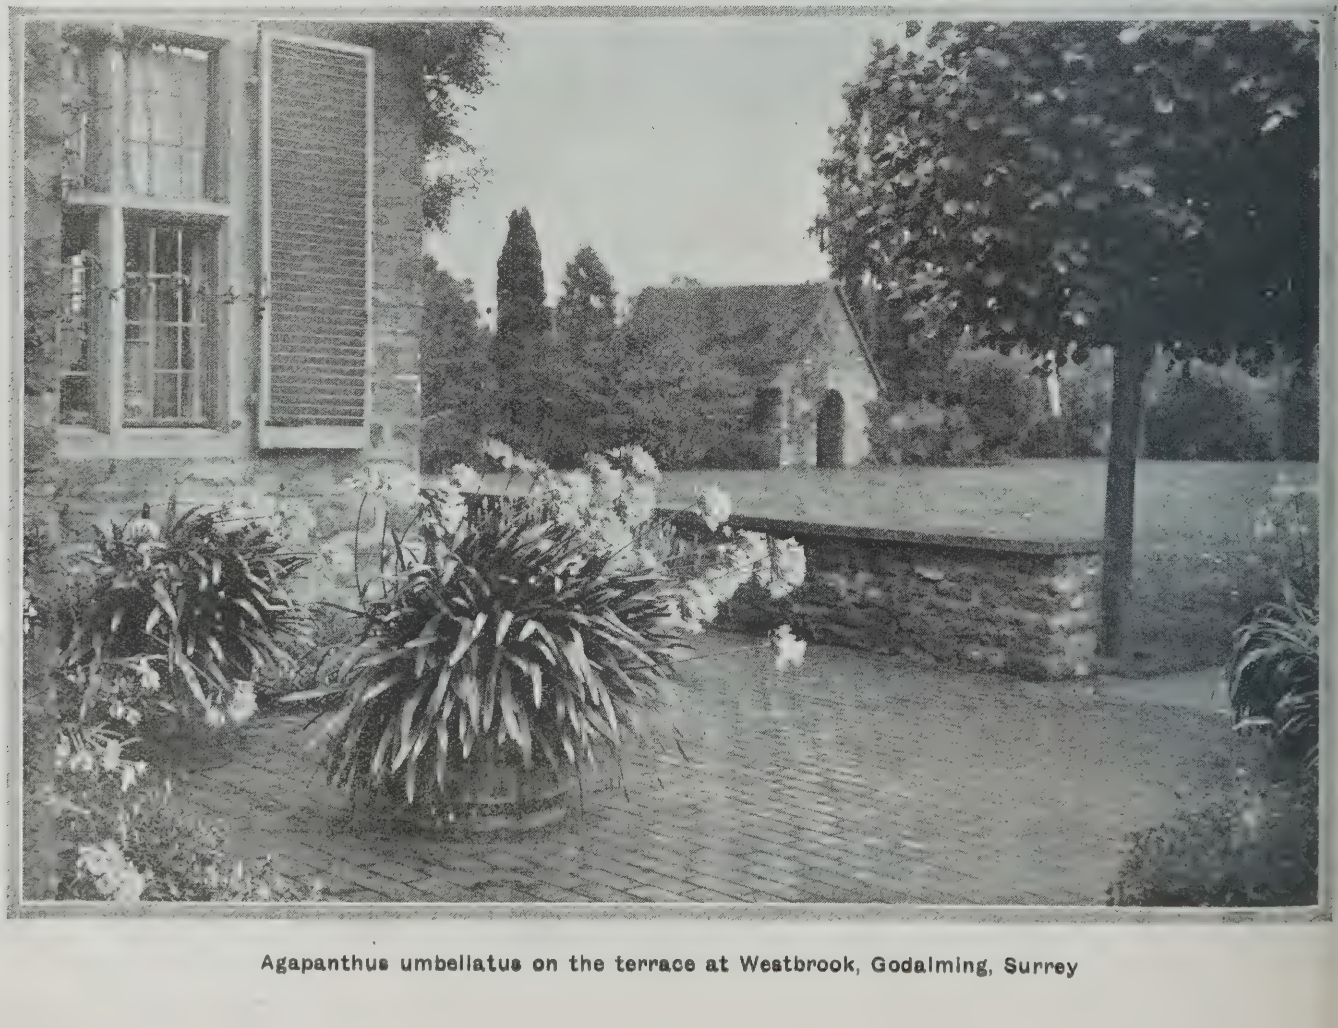
THE accompanying very charming illustrations show the value of the African Lily (Agapanthus umbellatus) as a tub plant for the fronts of houses, terraces, and courtyards during the summer months. It is rarely, however, that such an effective background for these handsome plants is to be found as that here seen in the picturesque house. Though various subjects are often recommended as tub plants, there is no doubt that the Agapanthus is unrivalled for this method of culture. Its requirements are extremely simple, since, when it has gone out of flower and the winter is approaching, it may be gradually dried off and stored during the cold weather under greenhouse stages or in any outhouse from which severe frost is excluded. These plants are sometimes grown in large pots, but this system is not to be recommended, since sooner or later the pressure caused by the great, tightly-compressed roots invariably breaks the pots. It is, therefore, advisable to choose receptacles strong enough to withstand this root pressure, such as tubs or boxes, which, if painted an unobtrusive green, cannot offend the most artistic eye. The lavender-purple of a couple of dozen tall, spreading flower umbels, towering above the drooping, strap-shaped leaves that almost hide the tub has a pleasing effect, greatly enhanced if a number of such finely-grown specimens are arranged in ranks in some conspicuous position. In the southwest the Agapanthus will grow permanently in the open ground without any winter protection. Clumps so grown are often 5 feet across, and carry from 30 to 40 great flower umbels in the late summer and early autumn. In some gardens large colonies are established in the grass, and present delightful pictures when in full flower. There are a white variety of Agapanthus umbellatus and also a deciduous species, quite distinct from the evergreen Agapanthus umbellatus, which bears white flowers, but which is not recognised in gardening dictionaries. The leaves of this species turn yellow in October and wither away, and the new leaves appear in March. It flowers about a month earlier than Agapanthus umbellatus, and bears taller flower stems, holding rather fewer blossoms. This and the white variety of Agapanthus umbellatus are both good tub plants.

Making up paths and borders

Winter time in the garden is supposed by some people to be a quiet or easy period. If so, so much the worse for the garden. Of course, the weather may bring about such a state of things, then nobody can be blamed but Jupiter Pluvius, but to talk about an easy time when the elements permit of work shows there is something wrong in the speaker's conception of gardening. To the man who takes a real pride in his garden winter is just the long-coveted opportunity for effecting those improvements which even the ideal patch is capable of absorbing.

Here is the opportunity for the amateur to abolish those mud puddles in his paths or to reset his beds and borders so that the summer shall yield greater pleasure and better results. To deal first with the making of paths, there is a great diversity of opinion as to which is the best materials for these. There can be no two opinions as to the mode of making, because there is a certain amount of science underlying the principles of producing the best results in these necessary portions of the garden which canno ignored. First, let the writer face the m and own to cherishing a terrible heres preferring paths made of cinders and a Of course, it is very wrong of him, practical considerations have their we In the first place coal-ashes, by reason o sulphur in them, do not encourage gr of weeds. Secondly, nothing else abs rain so quickly and dries so soon after ciently to give a serviceable surface for w ing on immediately. In the third place, do not encourage livestock of any kind, if the bordering material is nothing b than wood. Fourthly, and quite impor they do not dust up loose in dry weathe soon as gravel, and if wetted over be getting to this condition with salt and w they will even defy the driest weather.

However, enough of gnashing of amongst readers to whom even these siderations fail to appeal and to whom a on top at least, are anathema. Let us how clinker and ashes can help us to good gravel paths. Those who cannot the thought of them on top will not burying them. At a depth of 3 inche 4 inches they make one of the best fou tions on most subsoils. If on clay it is be first, to get out this a little deeper and 2 inches or 3 inches of hard core, buil rubbish, stones, or even old pots and p These latter help greatly in binding the w together and prevent sinking in places. there is a supply of them enough and subsoil is a wet clay a further few in more may be removed and filled up in way. Some good, large clinker is an e lent substitute. Do not ram this bottom in. Wait until the builders' rubbish, plaster, ballast, or rough ashes has spread over, then ram or roll over. gives better results. The top 2 inche



Agapanthus umbellatus on the terrace at Westbrook, Godalming, Surrey

ches should be gravel if ashes cannot be
ated.

any amateurs have just such a sneaking
rd for asphalte as the present writer has
ashes, but for practical reasons this is
ys really very undesirable. If such
s could be laid a year or two before the
en is required, well and good, but to lay
in one choicely planted is far too risky
ng to be recommended here. If a hard
is required nothing beats concrete, and
not expensive now. That last word may
ueried, but it is scarcely the province of
eners to know all about such a material,
ce it to say that to-day English Portland
ent is of such extremely high quality, as
le, that only a very small proportion is
ed to form good concrete paths. It is
manner of using it that counts. If the
$\frac{3}{4}$ inch is of fine gravel that will pass a
h sieve and clean sand the former can
our parts to three of the latter with one
ment. This should be laid on $1\frac{1}{2}$ inches
oarse gravel seven parts, finer gravel or
four parts, and cement one part. This,
rn, should be bedded down on a rammed
ace of rough stuff, clinker, etc., and the
ayer must be put on before the other has
oo hard to be impressed by a finger-nail,
harder than to show a thumb-print.

osely akin to paths and their lay-out is
planning of the flower-beds; in fact, the
ngement of the first should determine the
r. Too often in small gardens we find
imless wandering of paths in all direc-
without any specific object resulting
their planning. It is in these very
ens where such waste of effect cannot
fforded. If only a little intensive thought
estowed on the matter beforehand each
may end in some special feature that will
ccentuated and improved by the very fact
the path ends before it. One may
h before a rockery, another end in front
vase or bird bath, a third may come to
lusion in an arch with a seat under it,
so on, so that no walk leads merely into
her. A bed of scarlet Salvias at the end
walk, for instance, means simply a little
king out beforehand, but what a glorious
h for the path!

ne of the pitfalls the amateur easily falls
is the squaring of the ends of his paths.
, a square corner to a border or lawn at
unction of two paths is a veritable clash
leas. Above all things a garden should
atural, and Nature hates square corners.
s should not meet at right angles where
n be avoided, which is not often in the
l garden. Nevertheless, it is possible to
d the corners and sometimes to mask
by a judicious planting of suitable
bs, Roses, or plants—an equally de-
le thing to do. Where a border runs
to the walk the ends can be very easily
ned in this way with excellent effect to
whole arrangement of the garden.

is always a good thing to have at least
or two paths closely planted in this way.
re the garden is small there are several
reasons for planting the outer walks
go all round, and may have to be on a
r square plan, on each side with bedders
ch a way. With moderately tall plants
e outside—that is, towards the centre of
garden, and the ends of the paths
ked as recommended above, the im-
sion conveyed will be that the whole is
larger than it really is. This helps the
l garden, and if the middle is opened out
other walks and beds suitably arranged,
or without a lawn as desired, the effect
nsiderably increased, and added interest
its. There should be nothing square or
al in such a centre plan if the outer
s are so arranged.

AJAX.

Agapanthus umbellatus in tubs on the lawn by the flagged path at Spetchley Park

The work of Sir Jagadis Chunder Bose

(Concluded from page 98)

The amplitude of response from animal muscle can be altered very appreciably by altering the conditions of its environment, and similarly with the plant pulvinus. Certain reagents produce an enhancement of activity, whereas others are depressing. Others, again, may act in either way, according to the quantity administered. "An agent which in large doses proves to be toxic is found to be stimulating when given in minute quantities." Temperature, again, has a parallel effect in the two cases. In the plant there is an increase of excitability with the rise of temperature up to an optimum of about 34 degs. C., and conversely lowering of the temperature has a depressing effect. And lastly, excessive irrigation in both cases leads to undue hydrostatic pressure, with consequent loss of excitability.

An interesting feature of these investigations is the very prominent part that has been taken by the electrical experiment. Stimulation of animal muscle gives rise to an electrical response of galvanometric negativity. In the plant both electrical and torsional stimulation yielded the electrical response that is given by animal muscle.

Mimosa, however, is not unique in having a pulvinus; but those other plants that have pulvini do not show movement as obvious as that of Mimosa. Nevertheless, it appears the movement is there, but beyond the range of human perception. It can be measured, according to Dr. Bose, by his own hypersensitive apparatus. The reduced excitability of the so-called inactive pulvinus is concomitant with an absence of the granular "active substance."

The cortex, however, is not confined to the pulvinus. It stretches into the petiole in one direction and into the stem in the other. May it not be, then, that these tissues are also contractile? Dr. Bose has demonstrated a radial contraction in older stems and a longitudinal contraction in younger members.

In the animal kingdom nerves seem to be the essential complement of muscles. Does the similarity extend to this extent, that in the plant the muscle is stimulated by a tissue not unlike nervous tissue? Such, indeed, seems to be the case. "If physiological changes affect the rate of conduction then the impulse must be of a nervous character; the absence of any such effect, on the other hand, proves the mechanical character of the impulse." The nerve in the animal is absolutely independent of the muscle, and if the conducting tissue in the plant is of a nervous character it must fulfil this characteristic. "In Mimosa conductivity is independent of moto-excitability. The pulvinus may have been rendered immobile, yet the excitatory impulse is transmitted along the enclosed nervous tissue in both centripetal and centrifugal directions, causing the fall of other leaves on the stem and the closure of leaflets on the sub-petioles." The localisation of the "nervous" tissue is effected by the electric probe, and by double staining with safranine and hæmatoxylin. The two methods seem to be confirmatory of one another.

In plants, then, an impulse applied at a distance is carried along a nerve, which excites into activity a "muscle." Such in all essentials is also the process in animals. In the latter, however, the central nervous system comprises a brain which has directive force. In the brain perception is translated into action, the consequent movement being called voluntary. On the other hand, some movements take place without the consciousness of any perception, such being called involuntary movements, an example of which is the pulsation of the heart. The two terms are obviously inapplicable to the plant. It may be said, however, that the two have their counterparts in the plant. Voluntary movements are occasional, and the fall of the leaf of Mimosa is also only occasional. The rhythmic activity of the leaflets of Desmodium show, however, automatism not unlike that of the heart. The automatic movements of Desmodium and heart-beat are affected similarly by changes of environment, drugs, etc. "Chemical reagents induce reactions which are very similar in both animal and plant. Diminution of internal tension causes depression of heart-beat, and a decrease of internal hydrostatic pressure in Desmodium causes an arrest of pulsation." And, again, "variation of temperature induces characteristic modifications of rhythmic activity which are similar in the animal and the plant."

The principle of automatism is embodied by Bose in his explanation of the ascent of sap. According to this theory the sap is propelled upwards by peristaltic waves in a definite layer of cells—"the internal layer of the cortex abutting upon the young vascular tissue." Agents affecting the flow of blood have a precisely similar effect on the ascent of sap. The mechanism of propulsion in the two cases seems to be the same. Peristalsis forms the basis of the two processes. In the heart of the vertibrate the peristaltic action, although there, is perhaps not quite obvious. In some of the lower animals, however, the heart is little more than a tube, in which case there is no doubt about the peristaltic waves. Again, propulsion of the contents of the intestine is effected by peristalsis. In both heart and stomach peristaltic waves are propagated according to the law, that: "The direction of propagation of the peristaltic wave is from the more active to the less active point." The same law applies to plants. Thus, by stimulating either end of a quiescent stomach a peristaltic wave can be induced in either direction, and by suitable arrangement the sap can be made to descend instead of to ascend.

And similarly with other phenomena whose suggested explanations are equally unorthodox. Time, however, may perhaps confer upon Bose's doctrines the distinction of orthodoxy, but not before they have passed through the testing fires of severe criticism—and for such we venture to suggest there is plenty of room.

And the voice of incredulity echoes, "Perhaps"! Yes, perhaps, indeed, but

> "There are more things in heaven and
> earth, Horatio,
> Than are dreamt of in your philosophy."

The Garden of England

Our English hedgerows, with their
lands of Wild Rose, Honeysuckle,
Traveller's Joy, our Bluebell woods, and
commons glowing with Gorse and Heat
have given us the right to speak wit
sentimentality or exaggeration of the "
den of England." But this garden has
gun to melt away rapidly since the war,
every month some piece of the country
gives way to bricks and mortar. Suc
change must take place in some degree,
we still need more houses; but it is
necessary to destroy the beauty of our l
scape blunderingly and irrevocably as
are doing at present.

It is not a question here of pitting a me
æsthetic preference against an econ
necessity; for the effort to preserve the E
lish country side is not activated by a s
mental perversion of values, but by the d
to preserve something that is valuabl
itself. A house with a view is worth n
than a house without one and is taxed
cordingly, and the natural gardens of h
and hedgerow have the same kind of v
for the community as the private garden
for its owner. But although it is to
interest of everyone to preserve the view
the natural garden, it is no one's busi
to do so, and it is usually beyond the p
of the single private individual; so that
usually find ourselves looking on, helpl
and ruefully, while the damage is b
done.

Fortunately there exists a machinery
mobilising our forces and making them e
tive, for, in 1907, the National Trust
incorporated by Act of Parliament for
purpose of "promoting the permanent
servation, for the benefit of the nation
lands and tenements (including buildings
beauty and historic interest, and, as reg
lands, for the preservation (as far as p
ticable) of their natural aspect, features,
animal and plant life." It now hold
trust the Cheddar Cliffs, Wicken
Barras and Bolt Head (with their rare na
plants), Ashbridge Park, Box Hill, H
head, parts of the Lake District, and m
other places whose character and be
were threatened with destruction.

But although the National Trust is re
nised by Parliament it receives no help f
the State, and, in spite of the increas
its importance during the last few year
has less than a thousand annual subscri
so that its work is now seriously hamp
for lack of funds.

Professor Trevelyan, in his pamp
"Must England's Beauty Perish?"*

ysanthemums for cut flowers

Some grand late varieties

ANY people prefer the double-flowered decorative varieties to the single, and there are many beautiful varieties to se from. Those I am about to name are f easy culture, are free-flowering, and of nct and pleasing shades of colour. All , also, good stems, none of those in- d to hang their heads being included.

DECORATIVES

robably the very best crimson for Christ- and later is :—

ALDOCK'S CRIMSON.—It is of moderate ht. The flowers are of an exquisite red le and retain their colour almost to the A plant will carry from nine to 12 blooms. It succeeds in sprays, but is disbudded.

RIMSON CONQUEST.—Of a beautiful soft lish-crimson. Rather a tall grower, but good-sized flowers. Should be partially udded.

IFI.—A spray variety with neat flowers of easing shade of pink.

. W. THORPE.—This old incurved white ill very useful. Best disbudded, allowing ut nine blooms to a plant.

RS. W. STREATER.—A beautiful yellow t from the last-named and, if anything, more desirable. Requires same treat- t, but is a better grower.

N MEMORIAM.—Certainly the most lovely all crimson Chrysanthemums. Grown from six to nine blooms to a plant; dis- ded, nothing could be finer.

EAN PATERSON.—Must be disbudded, but a plant will carry 15 to 18 nice blooms. The colour, a reddish-orange, is very charming.

MARKET RED.—A good old spray variety. Best partially disbudded.

MRS. R. F. FELTON.—Another rich crimson, but quite distinct. Free-flowering. Good either in sprays or disbudded.

THE FAVOURITE.—One of the best late whites. Will carry a dozen nice flowers. Best disbudded.

YELLOW FAVOURITE.—Identical with the last-named, except in colour. A lovely lemon-yellow with a fine sheen. Treat like the parent.

NIVEUS.—Grown in sprays, on old plants, this is superb.

SINGLES

BRONZE MOLLY.—A very charming shade of bronze-yellow. Tall grower. Good in sprays.

CEDDIE MASON.—This old, bright crimson is still excellent. Best in sprays.

CLARICE.—One of the very best. Bright red with yellow zone. Fine in sprays. Stands long in perfect condition.

EVERLASTING.—Well named, as the beautiful light crimson flowers retain their beauty for a long time. Good in sprays.

EXMOUTH PINK.—An exquisite shade of true pink. A grand spray variety.

GOLDEN SEAL.—One of the best deep yellows, of grand habit and fine in sprays.

LADY ASTOR.—A fine variety in sprays. Rich deep crimson. Good habit. Late.

MARGARET.—One of the most perfect of the singles. Reddish-bronze. Best in sprays. Late.

MARY RICHARDSON.—One of the old indispensables.

MISS JOYCE MOORE.—Another grand deep crimson. Fine long stems. Good in sprays.

MOLLY GODFREY.—Although classed as an exhibition variety, this pretty pink sort is fine not disbudded.

MRS. EDWARDS.—A lovely bronze. Best in sprays.

MRS. W. BUCKINGHAM.—A lovely pink of similar shape and habit to the last-named.

MRS. LOO THOMSON.—A pretty pale yellow.

OFIA.—A beauty, but must not be disbudded. Deep reddish-bronze.

PHYLLIS COOPER.—Still one of the most beautiful of all single-flowered Chrysanthemums. Splendid in sprays.

RALEIGH.—One of the best. Deep crimson. This lovely variety remains long in beauty. Need not be disbudded.

ROBERT COLLINS.—A beautiful rich amber colour. Tall grower, but fine stems. Needs no disbudding.

SUSAN.—Another very beautiful variety with large, handsome flowers of a lovely bronze shade overlaid with pink. One of the very best. Tall grower. Needs no disbudding.

HELOISE.—Has Anemone centre. Very beautiful pink with a sheen of salmon. Unique colour. Beautiful in sprays. Does not last long.

C. BLAIR.

Preston House Gardens, Linlithgow.

Statice

The perennial forms of Sea Lavender are in these days very popular, as they are useful in those portions of the garden where change is not so much desired. Most of them are dwarf in character, seldom exceeding 2 feet in height. The broad, spreading panicles of flowers are in great request for cutting for the decoration of the house, as they last a long time in the dried state.

A cold, heavy soil they greatly dislike, but one that is sandy suits them to perfection, and they need no shelter in winter.

The best place for the Statice is a sunny spot on the south border, giving them ample roof for the development of their spreading leaves and flowers.

To increase the stock the best way is by division in the late autumn. They may also be raised from seed, but I do not advise the amateur to try it, as he will find it rather a long process. It will be better if he purchases plants.

On East Sheen Common (preserved by the National Trust)

Hybridisation of Lilies

Considering the advantages of hybridising evidenced in other bulbous plants, notably the Narcissus and Montbretia, it appears surprising that more attention has not been paid to the genus Lilium

(Continued from page 91)

LAST week I dealt with the principal types of Lilies and with rough indications of the most suitable species. After selection of the species most suitable for the purpose under consideration one should be sure that in each case the type to be used is the best of the species. Almost every species has two or more forms of which one must naturally choose the best. In every case habit of growth, floriferousness, and general hardiness should be considered. To illustrate my point I would point out that Lilium auratum platyphyllum must inevitably be chosen as the best of the auratums, if such were to be used. Lilium Humboldtii magnificum, by reason of its superior vigour and floriferousness, is preferable to the type plant, and Lilium Martagon Dalmaticum will give better hybrids than the common purple Martagon. There is small point in exerting care on the selection of a species and then utilising an inferior type, more especially when one considers that the production and fixation of a Lilium hybrid is a matter of years.

The actual cross-fertilisation does not require very great skill. It is not necessary to mutilate the flower which is destined to produce the seed so as to prevent selfing, since the pollen is not disclosed or active until some time after the flower has opened. The stamens must be removed as soon as possible after opening, and the individual flower enclosed in a fine mesh gauze bag to prevent accidental fertilisation by insects. It is also advisable to remove any flowers higher up on the plant that are not required for the production of seed, since pollen may be shaken off from these and penetrate the gauze. Hybrids generally follow the type of the female plant, so that crosses should be taken in the opposite direction to ensure a well-mixed batch of seedlings.

Although cross-fertilisation can be practised in the open, the results are more or less at the mercy of the weather, so that shelter is preferable for the plants. A warm and sunny day should be chosen for the pollination, and the plants should be kept rather drier than is the custom with the genus after impregnation has occurred. Do not be alarmed if the seed capsule is irregular in shape; sometimes all the segments are not completely fertilised, and consequently do not swell. This is no reason why the remainder should not be quite healthy.

Seed should be allowed to ripen as long as possible on the plant and then sown immediately in a finely-sifted compost containing three parts fibrous loam, two parts leaf-mould, and one part washed sand. It should be sown $\frac{1}{4}$ inch deep, and frame or greenhouse protection given to the seed pans. From this fresh seed germination will occur
either very soon or in the following spri
Seed that has been stored takes considera
longer. In any case, one should never
in a hurry to throw the seed pans away,
the seeds are very like those of Primulas
the uncertainty of their germination.

The soil should never be allowed to beco
at all dry. Watering is best done by s
merging the pans almost to the rim in wat
Alternatively overhead watering with a v
fine rose may be practised.

When the seedlings have two or th
leaves they should be carefully transplan
into a somewhat rougher compost of
same ingredients, with the addition of
part of very well rotted manure. I find t
the best accommodation one can give
young plants is a bed in a cold greenho
level with the outside ground, or a c
frame with walls of dead sods. Never all
the seedlings to lack water; on the ot
hand, do not give too much in the dorm
season. In summer protection should
given from very strong sun. The princi
enemy to cope with will be slugs, which
devastate a whole bed in one night. Mo
over, they are not content with the you
leaves, but will follow them down to
young bulb and eat that. Your own effo
are the only way to rid yourself of the
since the application of slug-killer is as lik
to kill the young plants as the slugs.

Hybrids of the trumpet types will
found to give little trouble in rearing, a
will flower in the third year with reasonal
attention. Martagon Lilies both of the C
World and North American types genera
prove more refractory. They are sometim
rather difficult to rear through their first a
second years, but afterwards will thrive qu
well in the open garden.

As far as possible, it is advisable to refra
from using hybrids for parents of a ne
series. As in other forms of life, a first cro
is generally vigorous and quite desirable, b
the intermingling of a third factor usua
tends to retrogression and often to impair
strength. Furthermore, whilst one ca
generally predict in a greater or lesser d
gree the characteristics that two pu
parents will impart to the hybrid produce
a hybrid invariably possesses recessive cha
acteristics which are apt to lead to quite di
concerting results in the second cross.
addition, hybrid Lilies, like other mules, a
sparing in the production of offspring, if th
produce any at all. The only time I thi
when it is at all permissible to employ
hybrid is when it is being crossed with o
of its own parents.

Finally, when the hybrids have flowere
be ruthless in your selection, although the
is, I know, a strong temptation to save qui
a few of the seedling plants. Save a
which mark a distinct advance on the
parents, but dispose of the others to mak
way for further batches.

F. MURRAY BARTLETT.

The Nankeen Lily (Lilium testaceum), usually regarded as a hybrid between L. candidum and L. chalcedonicum; origin uncertain

Godetias

The variety Lady Albemarle, as well
Duchess of Albany (white), Lady Rose (rose
and a few others have much to con
mend them as most desirable annuals f
culture in the garden. They are extreme
showy, and provided the old flowers are n
allowed to remain, give a charming displa
over a long time. When they do not turn o
well it is generally because they have bee
sown too thickly, and not thinned afterward
for they are not at all particular as to soi
and may be counted to bloom well in a tow
garden. On the other hand, few annua
respond more liberally to good culture tha
do these, and given a good loamy soil, int
which some rotted manure has been worke
one is rewarded by a continuance of flowe
for many weeks.

Ornamental plants

The class of plants known as sub-tropical re very popular and are quite distinct from nything else. Their culture is not difficult, nd when well grown and judiciously rranged they afford a very rich and tropical ffect in the flower garden. On the whole, he are of considerable value, as the large ed may be both quickly and effectively urnished with very much less expense and bour than with the usual run of bedding ants.

Under this term may be included Cannas, icinus, Wigandia caracasana with one or wo other species, Solanums of the S. bstrum class, the Cannabis or Giant emp, the variegated Japanese Maize, the ecies of Eucalyptus, the Nicotianas of veral kinds, and others, such as Perilla, maranthus rubra, and Coleus. Also may employed Palms of sorts, India-rubber ants, Dracænas, Grevilleas, and Acacias. hese, however, are of a more permanent racter and must be housed for the winter, hile the others may be treated as annuals, wing the seed in a moderately warm pit in e spring, when the plants become fit for se the same season and attain the height of veral feet, in some instances by the end of e summer.

F. H.

Salvia leucantha

This beautiful and attractive Salvia is a ate of Mexico. Its flowers are white, vered with a violet-coloured wool or down heir base. Salvia leucantha is a most seful subject for greenhouse or conserva- r decoration, coming into flower as it does s before Chrysanthemums.

Cuttings should be taken in the spring and oted in a medium of equal parts of loam d leaf-soil, and coarse silver sand. These ttings, if placed in a propagating case where a temperature of from 65 degs. to 70 degs. can be maintained, will soon strike root. When rooted pot on singly into 60-sized pots, using a similar compost as before, but of a coarser nature. When well established in these pots stop each plant to form a well-shaped and an evenly balanced plant. Pot on as required until the final potting is reached, which should be into 24-sized pots.

When all danger of frost is passed, place outside during the summer, growing on in the same manner as that recommended for Chrysanthemums. All Salvias are gross feeders, and all, as regard feeding, should be attended to, taking great care to house the plants before severe weather sets in.

Herts. E. B.

Lilium Farreri, the Marbled Martagon that

" . . . haunts cool mountain slopes
And river banks amid the coppice."

Lilium tigrinum splendens

The most richly coloured and the finest of all Tiger Lilies

Gypsophilas little known

Those who grow the most popular form of Gypsophila—viz., paniculata, are sometimes so taken up with its beauty as to forget that there are other sorts of different habit possessing pretty flowers, sorts that are at home planted in the rock garden, where they may trail and ramble, like repens, with blossoms of a pinky-white, and cerastiodes, of similar growth, having flowers also white, suffused or streaked with a violet-blue, and, lastly, there is G. elegans, which can hardly be described as a trailing variety, but which is charming for either rockery or border, and is almost indispensable when once it has been tried for mixing with cut flowers. The last is an annual, quickly raised from seed if sown now in a cold-frame or on a sunny border, whilst the two former may be raised from seed or cuttings, or by division.

REMINDERS FOR THE WEEK

Southern and Midland

Peas

A good batch of an approved early variety may now be sown in pots or boxes filled with good friable loam, to which has been added a third of old manure or leaf-mould and a little wood ash. For this purpose I prefer 5-inch pots, into which are placed eight or nine seeds 1 inch deep, and when so grown they are quickly handled, and may be planted out to form a complete row without the slightest disturbance of their roots, whereas if boxes are used it is generally necessary to shake the plants clear of the soil, thus producing a check to their growth at a critical time. Until germination has taken place, stand the pots in a warm house, and when all are through the soil remove to cooler quarters, keeping them close up to the glass.

Onions and Brussels Sprouts

Sown last month these will be ready for pricking off into boxes at about 2 inches apart. Continue to grow on in warmth for the present, keeping the plants near the glass.

Celery and Celeriac

A sowing of these important vegetables should be made and the pots stood in a house where a brisk temperature is maintained. Only a small quantity of seed should be sown—and this of early varieties—at this date, reserving the main sowing until a little later. Of the former, Bibby's Defiance White and White Perfection are excellent, and Delicacy is a delicious Celeriac.

Ground for Onions and Parsnips

Generally one of the first plots to be manured and deeply dug in the autumn is that required for the above, and providing that such ground can be caught in the right condition lose no time in applying a surface dressing of soot and lime and getting it forked over, as it may be possible to sow the seeds before the end of the month.

French Beans

Make a sowing of Earliest of All in 8-inch pots, and place in the forcing house, and from this date a fortnightly sowing should be made to provide a constant supply. Introduce further batches of Chicory, Seakale, Dandelion, and Rhubarb to gentle heat, and discard those replaced. The same remarks apply to Asparagus, forced roots being of no further use.

Hot beds

These are invaluable for bringing forward early crops of Carrots, Lettuces, Turnips, and Radish, and should be utilised to their fullest extent.

Indoor plants

The division, or potting on, of many stove and greenhouse plants is best carried out at the present time, and should be commenced forthwith, as such plants—with the increasing light and power of the sun—commence to develop new growth and quickly become re-established. Old specimens of Ferns, foliage plants, etc., may be freely divided up, and if a little extra care is taken regarding their water supply vigorous young plants will result.

Hippeastrums

A number of these should be introduced to a warm house from store, unless it is desirable to fill a whole house with them, as is occasionally done. Many prefer to shake out the bulbs and repot before placing them in warmth to bloom, but this is scarcely necessary every year. The pots should be placed close together upon a bed of gravel or ashes for preference, and have the syringe freely plied among them twice daily.

Early vineries and Peach houses

These maintain a moist, brisk temperature from this date, avoiding however anything approaching a fiery nature. Floors should be damped twice daily during fine weather, and where Strawberries and other plants occupy the shelves and stages of such houses the syringe should be plied among them occasionally.

Violets in frames

These will benefit from the increasing power of the sun, with the result that flowers will be more plentiful than of late. Air freely, but always on the sheltered side, and close the lights before the sun has lost its power. The surface soil should be stirred at intervals.

Fruit trees

Continue with the spraying of these on all favourable occasions, and any arrears of planting should be brought forward, although trees of all kinds may yet be planted with every prospect of success.

Plums and bush fruits

Watch and endeavour to frustrate the serious depredations of birds. Rarely have I seen so much damage inflicted at this early season upon trees, shrubs, and climbing plants by birds.

Gladioli, Dahlia, Salvia patens

These and other roots stored away must now be examined, and where extra stock of the two latter is desired, a few roots should be placed in boxes and stood in a warm house to provide cuttings. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Sow Antirrhinums

There is really but little advantage in sowing this very popular bedding plant much earlier than this date, for, like so many other kinds, this is very apt to damp off during the dull, short days, whereas now, with more daylight, the seedlings grow more rapidly and sturdily, and run less chance of being thus damaged. Very strong heat is neither necessary nor advisable, a general temperature of 55 degs. to 60 degs. giving best results. Sow the seeds rather thinly.

Lobelia from seed

There are several strains of dwarf Lobelia that come fairly true, both as regards habit and colour, when raised from seeds, and unless absolute uniformity is essential this method of raising large stocks of this plant has numerous advantages over that of doing so by cuttings. If not yet done, the seeds should be sown at once, using well-drained pans or boxes, filled with light, porous compost. Sow thinly to prevent damping, which is sometimes troublesome if the seedlings are at all crowded.

China Asters

While there is no particular hurry with the raising of this popular annual plant, it is really better to start a few days earlier than is usual, and instead of placing in strong heat, as is often done, a moderate warmth only should be given, when the seedlings will be sturdier and less liable to disease than by the former method. For cut-flower purposes, the "Sinensis" type is very valuable, and is easily grown.

Carnation cuttings

Another batch of cuttings should b
serted now, and these will be found to
more readily and rapidly than was the
in winter. The compost must be very sa
and the pots cleaned and well drained
gentle bottom heat is helpful, but strong
must be avoided.

Lettuces for early crops

By sowing a pinch of seed now in a
of light soil and pricking the seedling
when fit, fine plants for setting out
south border in early May will be got,
these will be fit for use a fortnight or
in advance of the earliest outdoor sow
Carter's Holborn Standard is an ideal va
for the purpose.

Brussels Sprouts for earliest use

To be certain of having a supply of
popular autumn and winter vegetable fi
use in October seeds should be sown
in a box and placed in gentle warmth. P
off when ready, grow steadily, but not
rapidly, and plant out early in May.

Cabbage and Cauliflower

By sowing a pinch of seed of each of t
now, fine plants will be available at lea
month earlier than would be possible f
earliest outdoor sowing. Treat as adv
for the Sprouts. A good Cabbage for sow
now is Dickson's First and Best, w

Answers to Queries

erles—Queries and answers are inserted in ENNING ILLUSTRATED *free of charge if corre- dents follow these rules: All communications ld be clearly written on one side of the paper , and addressed to the* EDITOR *of* GARDENING STRATED, *Bouverie House, Fleet Street, London, 4. Letters on business should be sent to the* ISHER. *The name and address of the sender required in addition to any designation he desire to be used in the paper. When more one query is sent, each should be on a rate piece of paper; the name and address g added to each. As* GARDENING ILLUSTRATED *to be sent to press some days in advance of queries cannot always be replied to in the immediately following their receipt. We do reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

TREES AND SHRUBS

lyptus to name

LEASE tell me the name of this wonder-ful Eucalyptus, which I have never seen efore and in which I am much inter- . I suppose there would be no chance of ing it here, even in a greenhouse?
merset. E. A. H. H.

he Eucalyptus is our old friend E. lus. No doubt our correspondent is un- iar with the mature form with sickle- ed leaves. It is quite likely it would for some years in Somersetshire. It well in the open at Thorpe-le-Soken, x, and Torquay. It should be noted that leaves are wide and blunt during its th and only assume the sickle form when s attained a tree status. The leaves much of their blue colouring, and droop tad of spreading out flat, and give the a very distinct appearance.]

FLOWER GARDEN

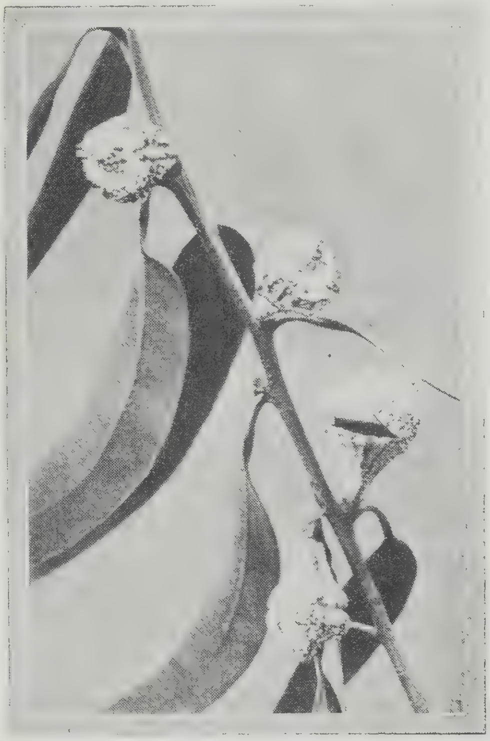
issus flowers withering

. V. R.).—Without being given the sary full particulars as to treatment we d say that your Narcissus bulbs have taken indoors before they had made a fient number of roots to live upon, and, nsequence, the flower-stems have not re- d sufficient nutriment for the develop- r of the flowers. Bulbs grown in pots d be buried in a bed of fibre or old leaf- until the pots are full of roots, and then should not be suddenly brought into a room, but should first come into a dframe, and then, when the flower-buds owing, it is safe to bring them indoors.

ilegia discolor

ll you, please, give me some information e following plants (locality, habits, culti- , colour, etc.), as I am unable to find eference in authorities:—Aquilegia dis- o and Hypsella longifolia? F.

quilegia discolor.—Under this name a ry firm have lately offered a plant we have not seen. On looking up the we find that Aquilegia glandulosa F. nto two forms—A. glandulosa forma (a.) or, described as blue and white by de olle, and A. glandulosa forma (b.) con- o also named by de Candolle. As far as an judge from contemporary writings ue Aquilegia glandulosa from the Altai tains of Siberia is not in cultivation at esent, and that all the plants distributed this name should rightly be called egia jucunda; if they are not, as often h happens, the hybrid known as A. tii. If our correspondent would furnish th leaf and flowers in the spring of his we would endeavour to classify his cnen for him, but without seeing material nnot be of much use to him, as we have far seen the plant offered under this Hypsella longifolia has lately been uced to cultivation by Mr. Comber from ountains of Argentina or Chili. Botanically it is closely allied to Lobelia and Pratia, and is a prostrate-growing herb, spreading rapidly by creeping stolons in any light soil and not too dry positions. It forms a close carpet of ovate-lanceolate leaves individually about an inch long, and from the leaf axils are produced the Lobelia-like flowers on very short stalks. These are white in the main, but variously stained or striped with reddish-purple. We find that in some gardens this plant has been introduced under the name of Selliera radicans. The plant appears perfectly hardy and may be used for positions as given to Pratias, preferably a slightly moist and partially shaded spot, and not too near weaker-growing plants which might be smothered by the insinuating growth of the Hypsella. It is probable that Hypsella would very soon need a whole sink garden for itself, but there is no reason why it should not serve as a very useful carpet for, say, the miniature species of Narcissi.]



Eucalyptus globulus in flower

Note the cap that is being pushed off the flower, also the sickle-shaped leaves

Lilium auratum

Can you tell me where I can get some English-grown bulbs of Lilium auratum?
A. M. MARTINEAU.

[We regret we cannot help you much in the matter of home-grown bulbs of Lilium auratum. Messrs. Bone and Co., 172, Easter Road, Edinburgh, or Dobbie and Co., Edinburgh, may possibly be able to supply. Owing to the particular climatic conditions Lilium auratum is more readily established in Scotland than in England. The majority of Lily specialists do not trouble to propagate this Lily from seed or scales, as the small cost of imported bulbs from Japan makes it hardly worth while.

Imported bulbs have been successfully established in a number of gardens, and, provided the right treatment is given, and not the very large bulbs planted, there is every possibility of success. We suggest, if you cannot procure home-grown bulbs, that you plant a few plump imported 9-inch bulbs. The important point in establishing this Lily is to remove the buds when they appear. This means sacrificing the flowers for one season, but the chances of establishing the Lily are increased certainly 75 per cent.]

Cannas and Pyrethrums

(1) Will you kindly advise me in regard to the cultivation of Cannas for summer flowering under glass? I have some dormant, but they did not flower well inside last summer.

(2) What is the best time to divide Pyrethrums? I have seen it stated after they have finished flowering, but I cut blooms right up to September last summer. C. H.
Surrey.

[(1) The Canna demands rich soil. A good compost would be three parts best turfy loam, two parts leaf-mould, one part well-rotted cow manure (use this dry), and enough sharp sand to ensure porosity. A fairly high temperature and moist atmosphere are necessary while the plants are making their growth, although when in flower they succeed all right in an ordinary greenhouse or conservatory. Start into growth now, but before doing so remove the weaker crowns unless very large plants are desired. Use pots just large enough to comfortably hold the clumps, moving them into those of larger size when roots are moving freely and the tops have made some progress. Keep clean by periodic vaporisings with nicotine. When the flowering pots are well filled with roots abundance of water and an occasional soaking of weak liquid-manure should be given.

(2) The best time for dividing Pyrethrums is in spring, just as growth is starting. Dig up the plants, shake away most of the soil, and then carefully pull to pieces with the hands. Each suitable piece should then be placed in a small pot, some light, sandy compost being worked in among the roots. Set in a cold frame, but do not keep too close or damping may be troublesome. Plant out after the roots are moving freely and a little top growth has been made. This may appear a little troublesome, but as the young growths escape the attacks of slugs and are less likely to be damaged by a spell of cold, damp weather it is worth it.]

Impatiens from cuttings

(Miss Charlotte Passmore).—(1) Although a perennial, Impatiens (Balsam) is always most satisfactory when raised from seeds each spring. They grow so rapidly that fine plants can be had in a few months. Seeds germinate well and quickly in a temperature of about 70 degs. This plant dislikes a dry, arid atmosphere, and it is, probably, because your rooms are warm and dry that the leaves and stems wither. A mixture of about equal parts good, fresh loam and leaf-mould, with enough coarse sand to ensure porosity, is what suits the perennial Balsams. Use very little fertiliser, and do not expose the plants to direct sunshine. (2) As our houses are almost invariably cooler than our glass-houses the reference to the process of hardening off will be quite clear to you, the book, of course, dealing with plants raised under glass, but intended to be grown out of doo during the summer. In your case it would be desirable, when taking plants from a cool temperature into heated rooms, to set them first for a few days in a room not quite so warm as the one which they have eventually to occupy, and so graduate the change for them.

Scabiosa caucasica from seed

Please give directions for growing Scabiosa caucasica from seed, describing proper characters of soil and fertilisers? I see that this plant is not recommended to amateurs, and, indeed, with me it has been poor in germination, weak in growth, and most niggardly in bloom; but I should like to succeed with it.

M. M.

[This is not the easiest plant to grow by any means. It is very resentful of cold, damp soils, so you would require to provide a well-drained site, with soil of a light, porous nature. Lime is also necessary, old mortar from a dismantled building being the best form in which to apply this mineral. Some well-rotted farmyard manure should also be dug into the ground some little time before planting takes place. The seeds should be sown thinly in a box of light sandy soil in spring, pricked off very carefully into other boxes. When fit to handle, shade carefully from the sun until well established, and grow on steadily until large enough to plant out in the garden, giving water when necessary, and again shading from the sun until the roots have got a good hold of the soil. We might say that the fine new hybrids are more hardy and easier to manage than is the type.]

FRUIT

Brown Rot of Apples

(Robinet).—We should like the opportunity of examining some specimens of your diseased tree to make certain that Brown Rot is the cause of all your trouble. Are you sure that Apple Scab is not present as well? If Brown Rot is the sole cause of the trouble you cannot do better than persevere with the collection of diseased foliage and fruit, and burning it. The wood is also attacked, and all dead wood should be also collected and burried. Go carefully over the trees and remove any dead wood; pay special attention to dead spur growth. You should try the effect of spraying the tree with a solution of lime sulphur at winter strength, following this up by spraying again with lime sulphur at summer strength. This second spraying should be done in the pink bud stage, *i.e.*, when the blossoms are showing colour, but the petals are not open. Write again if we can assist you further.

Fruit trees on chalky soil

(A. T. W., Berks).—(1) Apples likely to succeed on your soil are:—Bramley's Seedling, Bismarck, Lady Sudeley, James Grieve, King of the Pippins, Mr. Gladstone, Beauty of Kent, Dumelow's Seedling, Stirling Castle, Allington Pippin, New Hawthornden, and Peasgood's Nonsuch. Pears:—Souvenir de Congrès, Louise Bonne of Jersey, Hessle, Muirfowl Egg, Marie Louise, and Conference. Plums:—Victoria, Transparent Gage, Blue Orleans, Magnum Bonum, Prince of Wales, and Pond's Seedling. (2) Try George Bunyard and Co., Maidstone, or Rivers and Sons, Sawbridgeworth. (3) There is little or no advantage in placing flagstones under fruit trees. It used to be much practised, but nowadays improved methods of culture have taken the place of this and other doubtful devices.

VEGETABLES

Tomato planting

(Regular Reader).—From your letter we take it that the greenhouse you are renting has a 2 feet 6 inch path running down the centre and, therefore, if 11 feet wide, will have a border on each side of the path 4 feet 3 inches wide. If the pipes are on the borders they will further reduce the area. You should be able to plant your rows 2 feet apart throughout the length of the house, which you say is 60 feet, therefore there is room for 30 rows. The distance apart of the plants in the rows is not so easy because you have to consider the pipes and also the fact that you have not much head room at the eaves. Perhaps the best way of using the space available would be to place the first plant 3 inches from the edge of the central path, another 1 foot 6 inches away, and a third at the same distance, leaving you 12 inches clear between the wall and last plant. This last plant then would have head room of at least 3 feet, and should be profitable. In any case you should have three plants in each row on either side of your central path. You must work in the plants as best you can with regard to the position of the pipes. The plants near the path must not be too close to the pipe, but the nearer they are to it the more head room you can get for the others. At these distances you have room for 90 plants in each bed, making a total of 180 for the house. You will appreciate that it is somewhat difficult to give the distance apart without actually seeing the house. You would find that "Commercial Tomato Culture," by the Lea Valley Correspondent of "The Fruit Grower," is a useful guide to the growing of Tomatoes. Much information is given within the covers of this book, and it should be thoroughly studied before you invest money in Tomato-growing. The above book can be obtained from Ernest Benn Ltd., Bouverie House, Fleet Street, E.C. 4, at 2s. 6d. net.

MISCELLANEOUS

Frost records

(A. J. C.).—We are sorry that we cannot answer your query because we do not collect the necessary data from the whole of the south of England. You could probably obtain an answer to your query by writing to the Meteorological Office, Kew, Surrey.

Hard tennis courts

(R.).—Unfortunately, you fail to state what sort of finish is on your tennis court. The more modern require practically nothing but to be well swept, but those with looser surfaces may require to have a dressing of weed-killer and to be well rolled, while others may require to be given a slight dressing of the same material with which they were originally surfaced, which must be applied evenly and well rolled.

SHORT REPLY

Jeno, Sheffield.—Any good seed merchant should be able to procure for you Roman Hyacinths early in August, but if you have any difficulty write Messrs. Sutton and Sons, Reading, and we doubt not but they will be able to supply you. "Prepared" Hyacinth bulbs should also be procurable by the end of August, and these, if properly treated, should be in flower by Christmas.

NAMES OF PLANTS

E. B.—Aloe arborescens (tree-like), fairly common on the Riviera, but a native of the Cape of Good Hope. Flowers red in June.

L. E. Crofton.—Sarcococca sp. Not S. ruscifolia, possibly S. humilis.

A. R., Lanark.—The specimen sent is that of one of the Tydæas, a stove plant that requires the same treatment, soil, and temperature as the Gloxinia and Gesnera. It is easily raised from seeds, which, if sown in January, bloom the same autumn. It also roots readily from cuttings inserted no
in autumn.

Mrs. Ada V. H. Turner, Portland, O
Alstromeria Ligtu Var. angustifolia, rec
introduced from Chili. Is not at prese
commerce. Messrs. Ladham and Sons,
Shirley Nurseries, Shirley, Southam
have plants of an Alstromeria almost i
cal, if not better. We advise you to ap
them.

Mrs. H.—Crassula sp., probably
coccinea. Please send when in flower, v
should be in July. Native of Table M
tain, and is also known as Kalosa
coccinea.

Dartmoor.—The Snowdrop is Gala
Elwesii var. Whittallii.

Devonian.—1, Buddleia sp.; 2, Lardiz
biternata; 3, Buddleia sp.; 4, O
Forsteriana. We hope to give precis
termination of the Buddleias at a later
One of them is, apparently, a form
auriculata, which has an ochraceous y
flower and blooms in autumn.

NAMES OF FRUITS

Cup. He was Hon. Secretary and Trea
of the Ayrshire Otter Hunt Club.
funeral took place on Wednesday, Feb
6th.

Salisbury Gardeners' Societ

A lecture on soil sterilisation an
fertilisers

On Wednesday evening, February 6t
connection with the Salisbury Gard
Society, an important lecture was deli
by Mr. W. H. Turner, B.Sc., Tech
Adviser to Messrs. Geo. Monro, Ltd., o
particular values of certain fertilisers an
sterilising of soil.

The Lecture Room at the White
Hotel was well filled, and included fr
from Andover and other districts.

The lecturer having been introduce
Mr. S. W. Tucker, mentioned that the

(Continued on page 116)

BY APPOINTMENT.

LAWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS'
LAWN GUANO
(A Compound Fertilizer)

ıe safest dressing for turf. It feeds the turf over a long period and will not burn discolour the grass. Lawn Guano quickly strengthens the roots and encourages lense growth of fine grass. As used by important clubs and municipalities. Apply w at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**5/-**	**9/-**	**15/-**	**25/-**

FISONS'
BASE FERTILIZER

ould be incorporated with the soil before sowing grass seed. Specially prepared promote strong root growth and give new grass a good start. Use 4 ozs. to the yd. a few days before sowing the seed.

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**4/6**	**7/6**	**12/6**	**20/-**

FISONS'
LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed, such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.

Prices, in Kegs :	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**5/-**	**9/-**	**16/-**	**27/6**

FISONS'
GRASS SEEDS

are the finest procurable, being specially tested before selection.
Special Mixture (for Bowling and Golf Greens, finest grasses only).

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**15/6**	**30/-**	**58/-**	**110/-**	**210/-**

lisation of soil was nearly as old as cultivation. About the year 1800 large scientific discoveries took place, when it was found that plants needed carbon, sulphur, phosphates, potash, and nitrogen. Nitrogen was a most important plant food for the Cabbage family, while phosphates were particularly useful in the cultivation of root crops, and potash for fruit.

As regards organic manures, he was of the opinion that farmyard manure was far and away the best, particularly on heavy soils.

Proceeding, the lecturer gave some very interesting results from various trials that he had carried out, proving beyond doubt the wonderful strides that had been made through scientific research during the last century. With regard to partial sterilisation by the modern steam process the lecturer stated that the soil contained good and bad bacteria, and partial sterilisation killed to a very great extent bad bacteria, and so naturally purified the soil. It was the only sure method of killing fungus and other diseases. Very useful information was imparted which, if acted upon, will certainly improve the quantity and quality of crops.

Mr. W. F. Gullick, in proposing a vote of thanks, stated that this particular lecture was the 240th of the Society, and he never remembered a lecture of so technical a nature being delivered with such simplicity. They were not only indebted to the lecturer, but also to Messrs. Geo. Monro, Ltd., for having made it possible. Mr. A. J. Hooper, having seconded the vote of thanks, the same was carried with acclamation.

A remarkable collection of Potatoes was exhibited by Mr. W. F. Gullick. The Chairman stated that the Potatoes were grown in Fifeshire, having already been exhibited on three different occasions, and had been awarded a Gold Medal.

Sussex Shows

The dates of the shows to be held under the auspices of the Brighton, Hove, and Sussex Horticultural Society are as follows:—Spring, April 10th and 11th; summer, July 3rd and 4th; Chrysanthemum, November 12th, 13th, and 14th. The Committee is also co-operating in the management of the horticultural section of the Sussex County Agricultural Show at Preston Park, Brighton, on June 12th and 13th.

The Iris Society

The Iris Society is holding its annual show in the new hall of the Royal Horticultural Society on June 6th and 7th. It is expected that the show will comprise the largest collection of Irises that has ever been exhibited at one time, and it is proposed that the exhibition should be international in character. Accordingly, deputations have been invited from Iris Societies and Committees in the U.S.A., Canada, France, Germany, and Holland, and growers in these countries have been asked to exhibit. The show will be opened by H.E. the French Ambassador at 12.30, and will be followed by a lunch at which the Society will entertain its distinguished guests, and for which members of the Society will be able to take tickets. During this week representatives of the Garden Clubs of America—some 125 persons in all—are visiting the country. They will be invited to the show and will be entertained at tea. Besides the annual show the Iris Society holds at least two dinners in the year which are followed by a discussion. They publish two numbers of an illustrated Bulletin, of which Mr. Dillistone is editor. This contains a great deal of matter of great interest and importance to growers of Irises. The Society is also drawing up, under the supervision of Mr. Peter Barr, a check-list of Irises, and, under the editorship of Mr. Dillistone, is preparing for publication the writings of the late Mr. W. R. Dykes. All interested in Irises should join the Society, and, for this purpose, should apply to the Hon. Secretary, Mr. G. L. Pilkington, Lower Lee, Woolton, Liverpool.

William Lawrence.

Sweet Pea Annual

We have received a copy of the Sweet Pea Annual for 1929.* The first number was published 25 years ago. They have continued to appear annually since then, and have thus been a record of the transactions of the Society and the progress made in the Sweet Pea world. This year's is no exception, and includes among its interesting articles one on "Something New in Sweet Peas," by T. A. Weston, on the historical aspect of the subject, and three prize essays on "What the National Sweet Pea Society could do to further popularise the Sweet Pea." Reports of the various activities of the Society are given, together with lists of prizewinners and members.

TRADE NOTE

Treatment of grass

Should playing-surfaces be limed or should the soil be acidified? These are only two of the many theories which have been advanced upon the proper treatment of playing-surfaces, a subject upon which there are a bewildering number of different opinions, each with its enthusiastic upholders. Even the highly organised scientific bodies of this and other countries have been at variance upon this difficult matter. Each has experimented for a number of years with various types of soil and grass, and the resulting theory of each has been different from that of the others.

Although such organisations, by their experiments with soluble and insoluble material derived from various sources, are performing a perfectly safe and extremely valuable task, it is quite otherwise with the ordinary gardener or green-keeper. However practical he may be, he is running a grave risk by the indiscriminate use of fertilising chemicals, a procedure which, in untrained hands, may often prove extremely costly. The wisest course is to follow the counsels of some reliable manual.

For such a purpose the new catalogue of Messrs. Joseph Fison and Co., Ltd., of Ipswich, a copy of which has been sent us for review, is admirably adapted. It is clearly and carefully written, supported by all the weight of this well-known firm's experience and research, and steering carefully clear of the more extreme theories.

Ozothamnus rosmarinifoliu

To many of us who know and love
charming little shrub, Ozothamnus rosma
folius, it is distressing to come to a rea
tion of the fact that this delightful subje
not absolutely hardy with those of us
dwell away from the warmer districts of
isles. If given some protection, how
and by planting it against a wall, w
such shelter can be more easily supplied,
disadvantage may be neutralised, and we
enjoy its beauty for a number of years
is always a pleasure to give such a pla
trial without sheltering it in winter; bu
may have to pay for our experience, as
writer once had with the Ozothamnus, whe
lost a good plant which against the wa
his house had given great delight for a s
of years. As an experienced writer has s
"In most parts of the country it wil
quire protection, but may be classe
fairly hardy."

As to the plant itself, it may be call
"fairy-like" shrub of dense habit, com
of slender branches and twigs carryi
multitude of delightful, little, Rosemary
leaves, and in June and July so th
covered with small, white Daisy-like flo
as to look almost as if clothed in white
is a near relation of the Eurybias
Olearias, and the flowers resemble thos
that lovely shrub, but are infinitely sma
A light, well-drained, sandy soil, and a s
place against a wall will suit the Ozoth
nus best. A native of Australia, it was i
duced as far back as 1827. S. Arno

Taxodium distichum

The above, commonly known as
deciduous Cypress, and one of the
deciduous Coniferæ, is not often see
English gardens, but is a handsome tree,
whether as a large or small specimen i
attractive feature if rightly placed, alike
its shapely habit and its small feat
almost Fern-like foliage, of a rather un
mon shade of green. It attains a heig
about 100 feet in its native place (Flo
and is remarkable, I believe, there for
knobs or excrescences that come from
roots, but I have not seen this in Englan
any trees more than three parts of the h
above named. The object of this note,
ever, was to draw attention to the valu
its partially decayed foliage as a winter
tection for crowns of flowers left in
ground through the winter months w
although practically hardy, are apt t
nipped in very severe weather. The fol
although small and fine, is of a tough
ture, and takes much longer to com
decay than the majority of leaves; als
does not go into a hard cake with frost
lowing wet as in the case with some mate
used. A couple of inches of this kept i
place by a few twigs keeps out very s
frost. E. Burre

Early Peas

Many, of course, start their earliest
in boxes, but even where this is practise
is essential to seize the first favou
chance to have the earliest out-door so
put in. A sunny southern border will
best results, and here in the north The
is the most reliable variety.

Seed sowing

Seeds should now be sown of Rose spe
Clematises, Vitis Coignettiæ, Celastrus,
other trees, shrubs, and climbing pl
Well-drained pans or boxes of sandy
should be used, and after a good waterir
these may be either placed in a cool fr
or in gentle warmth, where a few seeds
probably germinate in a fortnight.
majority, however, require a year,

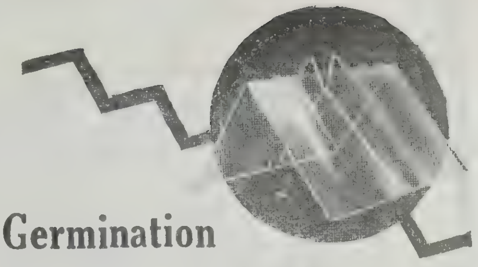
BULWELL, NOTTINGHAM



Germination wonderfully improved!

EARLIER, BIGGER, BETTER CROPS OF FLOWERS, VEGETABLES, SALADS

Cold, Wet, Wind, and Birds defeated!

THIS year why not make your own climate and sow safely six or eight weeks earlier in *whatever part of the garden is most convenient?* Thus you get wonderfully improved germination, and rapid, unchecked growth. Earlier flowers, vegetables, and salads mean a longer productive season—increased pleasure in gardening, and increased profit, too.

Protect 1929 sowings with the CHASE CONTINUOUS CLOCHE. All are taking up this great aid to successful culture. Last year alone we sold *miles of cloches*, and have enthusiastic letters from customers all over the country.

LOW PRICES

Complete Sets from 17/- Carriage Free

Now is the time to make yourself independent of the weather. Start early and make a full season's use of the cloches.

A set of 52 "A" size cloches as above, to cover 60 ft. of row, for **45/-** carriage free. Half quantity for **30/-**, and trial dozen for **17/-**. Please send now for illustrated list.

FAIRFIELD HOUSE BRADFORD-ON-AVON

"A Colas Path."

Perfect your paths with Colas!

A dressing of COLAS will not only lengthen the life of your pathways but it will also entirely *eliminate the usual constant attention* they require.

COLAS arrives *ready to apply* and can be put down by anyone at any time of the year, providing gravel drives and paths with a clean, lasting surface at a low initial cost.

One drum containing 30 gallons, costing 40/-, delivered direct to destination within the Railway Company's free delivery area, will cover approximately 100 sq. yards of gravel drive or path. A considerable reduction is offered if two or more drums are ordered.

Write to Estates (K) Dept. for 24-page booklet and prices.

Winter Gleanings

ERE are people who look upon a gar-
n in winter as a monotonous affair;
leed, I have heard, more than once,
garden in winter is a monopoly of
ion. Needless to say, the individual
ould make such a sweeping assertion
true lover of Nature at any time, and
a garden is adorned with a blaze of
he or she would not so much as glance
direction. The fact that Nature is
a well-earned rest during the winter
does not receive even a small thought
ich a person.

could we, who live so near
ure, call a garden mono-
during the dark months? I
ot. We know that practi-
l plant life in the garden is
but we realise that it is not
time for us. There is so
o be done that can only be
while things are dormant,
te often you will hear a con-
us gardener say that the
winter are much too short;
riods of rain or snow cause
xiety, work will get out of
nd Nature will awaken long
he is ready for her. And is
t likely to be the case this

It was probably sorry it had been
rom us so long! But one could quite understand an inspiration occurring to write on a theme of Peace, or even Rest.

Even the most patient of us are, perhaps, inclined to a longing for the brighter days to come, if only for our own comfort, and the middle of February still seems a long way from the sunny days of May, but so far as Nature is concerned she is content, and her sleep is really very short, for although she is not yet awake, there are indications that she is getting restless and may rouse herself at any moment; at least, that is how it seems. Are not the Snowdrops nodding their dainty heads in the bitter breeze? And the perky Winter Aconites, not to be outdone, are glaring at us with heads of brightest yellow. Even an Iris (I. stylosa speciosa), under the shelter of a greenhouse wall it is true, has adorned itself with three magnificent blooms of charming pale mauve. Just round the corner, trained to a wall, is the Japanese Winter Flower (Chimonanthus fragrans), with quite a lot of flowers of a yellowish hue, giving off a scent unequalled by any of the summer flowers. You might easily walk by without noticing the flowers, they are so inconspicuous, but you would wonder where the fragrance was coming from. A little farther on Jasminum nudiflorum is rampant, with its dainty yellow flowers. How we appreciate its gallant hardiness!

February flowers

Erica carnea (the Winter Heath) forming a broad and splendid carpet of rosy red hue

A few minutes' walk brings us to a tuft of Erica carnea (the Winter Heath), and it has been showing its rosy-red flowers for a week or more. In a few more days it will be perfect, and what a picture it would be one morning to find the tiny bells just showing through a coat of snow. But that is an event more than likely to happen yet.

Daphne Laureola and D. Mezereum are scoffing at the inclement weather, and the plucky blossoms are so delicately fragrant.

The pale yellow flowers of Corylopsis spicata are just showing. Could anyone fail to admire it?

Viburnum Tinus (syn. Laurestinus) is, perhaps, so common that we seldom glance in its direction, but if it was rare we should go into rhapsody and call it a gem! It is strange, but it was ever so. When you have got a thing you do not want it. But the fact is, this shrub *is* a gem, all winter-flowering shrubs are, and we should appreciate them more. Viburnum Tinus is a picturesque subject and its flowers are opening to February's harshness.

Quite a lot of Primroses are blooming beneath the shelter of shrubs, banks, and trees, and more will come out by degrees, the forerunners of a vast army to come in March and April, and perhaps this dainty flower, such a favourite of childhood days, when we would go "a Primrosing" in the woods, thrills us more than any other. Its beautiful simplicity in itself, and gorgeous radiance when numerously carpeting the soft glades of the woodland garden, is unequalled even by its gallant forerunner, the Snowdrop. To be walking through a woodland in January or February and suddenly be confronted with a bunch of premature Primrose blossoms is enough to reach the heart of the most casual observer, and one could almost picture the tender blooms repeating the cheery little verse in John Oxenham's "Bees in Amber":—

"Though the times be dark and dreary,
Though the way be long,
Keep your spirits bright and cheery,
Bide a wee, and dinna weary!
Is a heartsome song"

as though to cheer us on towards spring.

In the garden itself the Primrose's more elegant sister, the Polyanthus, has been struggling all through the cold, dark days to keep a few gaily-coloured flowers above ground, and now seems to be making an extra effort to overcome the clutches of winter. Is the effort appreciated as much as it should be?

So one could ramble on. In every garden no doubt there are gems flowering and craving admiration, and they are worth it. Perhaps an Anemone or a Saxifraga, perhaps a tiny Cyclamen or a Scilla sibirica. Whatever it is, it is a gem if it is braving the first months of an English year. In gardens more south than this no doubt there are many things flowering, but wherever a garden is situated it is not without some interesting features, and if man plants judiciously of subjects that claim the winter months as their flowering period, then Nature will do the rest. Nature goes to sleep, but she really only closes one eye. Is it not so? H. W. STENNING.

Our Jubilee Number

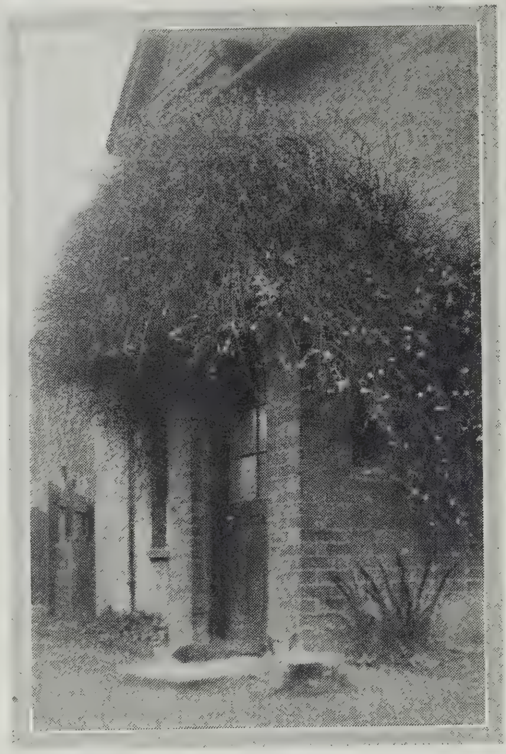
With our issue dated March 16th, "Gardening Illustrated" will celebrate its 50th birthday. This is an interesting event, and it is our intention to celebrate it in a manner worthy of the occasion by publishing a special Jubilee Number. This issue, which will be enlarged to more than twice its usual size, will contain special articles, both retrospective and prospective, summarising the progress made in horticulture in the last 50 years.

Readers can assist in making this number as representative as possible by sending illustrations and short articles of events of outstanding importance in the horticultural world during a half-century.

Every care will be taken of old prints and MSS., and those used will be returned to the senders after publication.

Letters should reach the Editor not later than February 28th.

The Jubilee Number will be published at the usual price, 2d.



"Rampant with its dainty yellow flowers"

Jasminum nudiflorum in Berkshire over a cottage porch facing north

The Garden Club

On Tuesday, February 26th, Mr. Symons Jeune, whose rock gardens at Chelsea have been so much admired, will be the guest of the Garden Club, and after dinner will give a talk on the garden in winter, with special reference to rock gardens.

South Dublin Show

The South County Dublin Gardeners' Association, which works in close co-operation with the local Horticultural Society, is holding a spring show this year on April 3rd at the Town Hall, Dun Laoghaire. Particulars of this show can be obtained from Mr. F. H. Meade, Park Lodge, Castlepark Road, Sandycove.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Proposed Society of Garden Architects

HAVING read with interest and amusement the correspondence about promoting garden architects, I am moved to ask whether there would be enough work for many of them. Is it possible for any but wealthy people to make a garden all in one sweep? Have not the great majority of us to wait and let our gardens grow by degrees, gradually evolving themselves into wider interest year by year? The price of labour is so very high that having in an extra man to make a few new flower-beds and paths once a year is about all most people can afford. I also think gardens are really much more interesting when they are made by degrees. Each season one gets some new or rare plants and sets about making fresh and suitable quarters for them, so that every year provides a novel interest, with something different to look at in addition to one's old loves. Surely gardens like Canon Ellacombe's were made thus?

After all, there is no possibility, apart from possible eccentricities, of any architect or anybody else creating a formal garden that is entirely new and original any more than totally new and original rock gardens can now be produced. (If one were made of coloured marbles and planted with hitherto undiscovered plants, or ones that no one can grow, it might for a few months be a complete novelty, but the idea would not be worth encouraging.) For my part I should like to see a Society for Remaining Old-fashioned inaugurated. The members would have to undertake to spend all their money on plants and nothing at all on fees, or crazy paving, or more rockstone than their plants absolutely needed, or flights of steps and tap waterfalls, or, worst of all, the modern designer's idea of a garden statue. When I look at the lead figures (*tempo circa* Queen Anne, of fragrant if vinous memory) of the seasons and then at certain amorphous creations in modern stone art I could weep for what we have lost and gained.

Another point is that if you can manage to make your garden yourself it is yours entirely and has a soul. If you only buy it son else has bought, or can buy, exactly the thing. I believe lots of people will feel And those who know so little about ga that they cannot make one themselves surely find more interest in learning th owning a reach-me-down.

And how on earth is the Society goi test its members? It will be very intere and not too easy, to invent a suitab amination for them to pass. M. L.

Sedum spathulifolium

It was a pleasure to read Clarence E complimentary remarks about spathulifolium and to know that this d ful succulent is doing so well in E gardens.

In its native haunts S. spathulifoli found surging over huge grey boulder often becoming mixed up in a deli manner with various Mosses and th Delphinium nudicaule. It is the mos mon species of Crassulaceæ in the no part of California, and is usually greg on half-shaded rocks in the foothill mountains up to an altitude of 5,000 fe

As the season of drought advances, th red tints creep up the flowering stem great heads of yellow flowers which out against the soft grey rosettes of f and the gorgeously clothed rock in its of evergreen trees makes a never forgotten sight. LESTER ROWNT

Carmel, California.

Fruit trees and birds

"H. C. G., Devon," complains birds, probably tits, picking out the bl buds on some of his Apple trees. He among the many who thus suffer b demolition during the winter and spring, when food is scarce, so say but it is more than doubtful if that h thing to do with it; no doubt they some benefit from it, as the buds are and tender, but are they hard up fo except during very severe frost or the ground is thickly covered with Food, such as worms, crumbs, and g be found on the roadside should go way to relieve their hunger. Last these pages I complained of the massacre, which was freely discusse by week, but no definite preventati tabulated by any one writer. Your spondent, "H. C. G.," cannot do than follow the advice tendered by the in his reply to Mrs. A., Co. Cork, same issue *re* "Bullfinches and Whether the winter is comparatively exceptionally severe their depredatio about the same. J

Truthful catalogues

"J. R. K." (page 103, issue F 16th) seems to consider nurserymen only show plants, etc., in the same development as he could produce This, of course, might be very easy f to do, but has he thought what would general effect upon the shows? He they do show them as they describe their catalogues, therefore they pro can produce what they describe.

Most nurserymen are quite willing their clients their methods of growing very difficult plants if asked for, and there not the weekly gardening pap books, also, upon every branch of ga to be obtained without expecting men to go to the expense of printi every time they issue a catalogue? quite aware that for those wh "J. R. K.," are only in the va horticultural skill, they do set

t, perhaps, for them to climb, but
they prove it can be done by patience
erseverance, and hard work and atten-
o every detail, but it will certainly not be
by being peevish and disgruntled, as it
nan's job really, or yet by imitating the
nd the grapes. Neither do I believe it
horticultural shows we want the valleys
exalted and the mountains and hills to
ade low. A. Casburn.
nbridge.

We do protest most strongly at the
ation conveyed in some of the corre-
ence in your paper that descriptions of
in nurserymen's catalogues are un-
ul, as that is what the imputations
"J. R. K." has no right to make
weeping statement which appears in
issue of the 16th inst. that "the glow-
erms of catalogue descriptions" are
representative in most cases of the
standard of a particular plant as
in gardens or for commerce," and we
nge him to name a single plant offered
ur own catalogues which has an
erated description. It is our practice,
ve have no doubt is the practice of all
rincipal British nurserymen, to con-
check catalogue descriptions with
tual plants when in flower—not taking
escriptions from show specimens, as
. K." infers, but from the plants grow-
the open field, from which customers
pplied.

complaint that nurserymen hesitate to
se the secret of cultivation is also un-
ed. In common with many other
ymen we give, as far as space permits,
l cultural directions, for the obvious
that it is in the interests of a nursery-
hat his customers get satisfaction and
eased with their purchases.

must admit that we sympathise with
who complain in respect to colour de-
ons, but, as is evidenced from other
pondence in Gardening Illustrated
other papers, it is simply impossible
describe a flower as to give the same
ssion to everyone, for the following
s, which we think most of your readers
ppreciate :—

(1) No two people agree as to the cor-
ct names of colours excepting the
imary colours.

(2) It is open to question whether
rying shades of colour give the same
nsation to all.

(3) The actual colour of a flower
ries according to the quality of the
ght. A flower presents quite a different
ade of colour on a dull day to that on
bright day, and is frequently of a dif-
rent shade in the going down of the
n to what it is in the morning or at
onday.

(4) Flowers will vary in shade con-
quent on the different chemical con-
ituents of the soil in which the plant is
own.

se facts are all well known to those
ve their gardens and their plants, and
erely mention them as reminders to
eaders who may not always agree with
ymen's descriptions.

conclusion we would suggest a little
charity on the part of your corre-
nts, and on behalf of an old and
rable trade to assure your readers that
British nurserymen do their best both
interests of their customers and of
lture as a whole, and deserve better
ur correspondents than thoughtless
Barr and Sons.
Street, Covent Garden,
London, and Taplow, Bucks.

Galanthus byzantinus

The excellent illustration of Galanthus byzantinus on page 86 prompts me to make one or two remarks about it. This Snowdrop was not introduced at the time of the Snowdrop Conference of the Royal Horticultural Society, and no mention was made of it in Mr. Burbidge's exhaustive synopsis of the genus read at that Conference. Since the Conference G. byzantinus was introduced from the European side of the Bosphorus, but does not appear to have been in commerce until sent out last year by Messrs. Barr and Sons. I have the pleasure of having it in flower as I write. Shortly after G. byzantinus was discovered a correspondent in Broussa, Bithynia, sent me a consignment of collected bulbs of a Snowdrop from the Broussa district. These proved a very mixed lot and were, to all appearance, natural hybrids of G. Elwesii and G. plicatus. Some had the Elwesii flowers and many the foliage of G. plicatus. I sent some specimens to Mr. James Allen, who considered that they were the same as G. byzantinus, and sent a specimen or two to a high authority, who indicated their closer resemblance to G. byzantinus. I lost my plants of this Broussa Snowdrop prior to 1903 from the attacks of the Snowdrop disease (Botrytis galanthina), which at various times attacked different species and varieties, but appeared to be more than usually virulent with this Snowdrop.

S. Arnott.

On seedlings

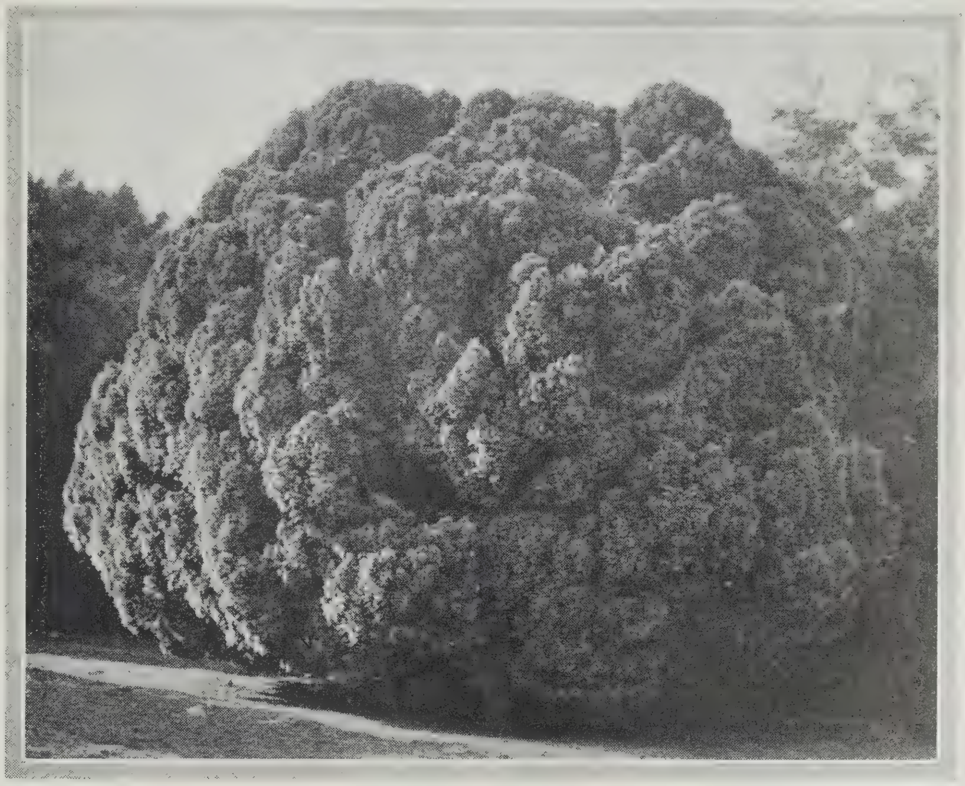
Owing largely to my want of skill, but partly, no doubt, to my cold, wet soil with a northern aspect, and want of suitable appliances, I am a very unsuccessful raiser of seeds. One of three things usually happens, either they fail to germinate altogether, or, after germinating, they all damp off, or else I obtain a large stock of things of which I only want from one to half-a-dozen specimens. It has often occurred to me that nurserymen might supply my deficiencies by offering seedlings for sale, and I have just received a catalogue from Messrs. Storrie and Storrie which does so. The varieties they offer are not very numerous, but there are quite a number of the commoner annuals and perennials which are useful. I think it is an example which might be followed by others.

A. H. Wolley-Dod.

A remarkable form of the common Yew

THIS photograph, which was taken in 1880, is that of a Yew at Cherkley Court, Leatherhead, now the seat of Lord Beaverbrook. At that time Mr. Abraham Dixon was living there. He used to have a large conservatory in which he grew Bananas and the Victoria regia. There are many Yews of this type in the neighbourhood, notably on the top of Boxhill. The varietal name, "Cauliflora," has no botanical authority, neither has the specific name, "magnifica"; it is merely a jest perpetrated by my father, who received a classical education at Winchester.

William Lawrence.
Burford, Dorking.



Yew at Cherkley Court. "Taxus maximus cauliflora!"

Begonias as house plants

I am indebted to your readers, "H. H." and Mr. W. J. Robinson, for expressing in your issue of February 2nd their views under the above heading.

Mr. Greaves suggests that lack of attention is usually the cause of most Begonias proving unsatisfactory as room plants. I can, however, assure him that I have done everything that is humanly possible without success. No, I think the only explanation is that Begonias will not respond to the effects of sudden changes, whether in temperature or treatment. A sudden rise in temperature after a dull, cold period will result in the dropping of many blooms, even when the plants are grown in a greenhouse. Exhibitors know this to their cost. Also a change in the system of watering, *i.e.*, by giving too much water if they have been grown on the dry side, and *vice versâ*, will prove equally disastrous.

I can only confirm my previous advice that readers should go warily before taking their best double Begonias indoors, even for a

An indispensable Alpine: Lithospermum in the Wisley rock garden

couple of days, otherwise they can only expect disappointment. In these matters one exception does not prove the rule. Begonia blooms will, however, last quite a long time if cut and placed in a bowl with a little water.

I have not tried single Begonias as room plants for some time. As I fertilise my own double Begonias I do not now grow singles or semi-doubles in the greenhouse. May I suggest that Begonia growers who are in the habit of growing only named varieties try their hand at fertilising and raising their own Begonias. I can assure them that it is a most fascinating hobby. If suitable parent plants are used 100 per cent. doubles can be expected, but the real joy is the chance of a few tip-toppers equal to named varieties, but different in form and colouring to those usually seen in ordinary collections.

E. R. Blunsden.

The Bungalow,
Westbury-on-Trym, Bristol.

Rock Gardens at Chelsea

The fun and fury resulting from Col. Durham's letter have not ceased; certainly not since Mr. Elliott has entered the fray. This is another battle of the gauges, and who gauges rightly? Great is Diana of the Mountain Limestone, and the cry is, Don't touch our idols.

In the correspondence much has been said about the ideal stone, but no one has ventured to describe it. What, then, is the ideal stone?

Certainly its first quality should be that which is conducive to the growth of Alpines, in all their beauty, of the majority of plants. As most of the Alpines revel in lime, it should be a limestone—a silicious limestone for preference. The stone should be absorbent, so as to give off moisture in dry weather to plants growing upon it. And it must, at the same time, be frost-resisting. It should be one that quickly weathers a nice colour, and grows its beautiful Lichens and Mosses. It should also be free enough working so that, when necessary, it can be broken to size.

And lastly—with apologies to the pulpit—but by no means least important, it should be at such a price as to bring it within the range of the pocket of all rock garden lovers.

Does the mountain limestone cover all these points? How many centuries of centuries has it taken to get its weathered faces, and what are its absorbent qualities?

As a plant lover I think that it is a great delight to see all the plants happy and thriving, and the mass of rock taking a second position. A few pockets can easily be constructed for the sandstone and magnesium limestone, and these plants must not be neglected.

J. J. Gething.

Chilmark.

—— It is with interest I have read the letters concerning the rock gardens at Chelsea, but, convince a man against his will, and he is of the same opinion still. What a blessing it is that we cannot get permission to transfer Eridge Rocks, Harrison's Rocks, or even the High Rocks from Tunbridge Wells to Chelsea, otherwise I am sure Messrs. Wood and Dillistone would have a cut at it and forget all about the Westmorland, Yorkshire, or Cheddar stones.

When Mr. Wood introduced the goats he gave us a very well-deserved knock, *i.e.,* to put on a rock garden that which belongs to it. When Mr. Elliott says, "as things are now the exhibitor has no idea for what prizes are being awarded," I very much doubt if he is correct. In my opinion, the prizes are awarded for the best window-dressing. Have we not seen at Chelsea, Heather in crazy paving, rich soil loving herbaceous plants on the rocks? Mr. Wood said to me at the last Chelsea Show: "We are all out for business. Each man must do his best for that purpose according to his own conviction. The judges are out for show. Exhibitors should know what to expect. The show comes to this, are

Lithospermum prostratum

IT is no exaggeration to say that
spermum prostratum is one of the
delightful and pleasure-giving plant
could be imagined. Of a dwarf, tr
evergreen habit of growth, it is an idea
ject for the rock garden or dry wall, wh
can hang downwards over the face
rock or wall at a suitable height, wh
can be seen and admired to the best
tage. It is a neat-looking plant at all s
of the year.

As a member of the Boraginea
whole plant is thickly covered with
which is characteristic of most other
belonging to this family. The rough
green leaves are of good substance and
hard. In winter they assume a bron
pearance, but the plant does not lo
neatness and attractiveness, even at th
period.

The flowers, which are a beautifu
blue, are tinged with red on openin
later on the colour becomes a pure bl
creasing in size to about ½ inch across.
mencing to flower in May, it is stead
continuous over a prolonged period.

Although one often sees it recomm
for growing on dry slopes and in bord
is, undoubtedly, a plant adapted for pos
such as those mentioned above, where
trail or hang down. Once the plants

Pentstemons dying

Although the ordinary hybrid Pentst
of the border and bedding class never
in this garden most other kinds are
succumb suddenly to that mysterious
which has troubled growers of this ge
a long time. Just as a Clematis
vigour and growth will sometimes dro
die with tragic suddenness, so these

ons often go off in a few hours. The tiful P. heterophyllus lives the most preus life of all, for any moment, usually coming into bloom, it may wilt and e, and thus, one by one, will a whole ation depart. But last season strong s of P. Eatoni went in the same and not even the more shrubby kinds, Six Hills Hybrid, are exempt. Is there, wonders, anything that will prevent sudden deaths? J.

Dodecatheons

HE genus Dodecatheons, a member of he Primula family, comprises several pecies of highly ornamental hardy ceous perennials admirably adapted for moist situations in sheltered parts of the garden or border. They delight in a le loam, rich in humus which retains ture in the growing season, but they ld never be planted in positions fully sed to continuous sunshine. The es resemble each other so closely that authorities treat them all as varieties . Meadia, which is at once the most lar and useful member of the genus and rise to numerous colour forms ranging rich, rosy crimson through intermedihades to pure white. Introduced from Western States some 200 years ago it ong been a popular plant in our gardens, its opulent tufts of oblong spathulate s surmounted by numerous slender es, each carrying as many as twenty ping, Cyclamen-like flowers, make the peculiarly attractive. The flowers ar in April and May, and remain a conable time in beauty, and the foliage cons to be decorative until the autumn, it gradually ripens. Division of the ns, which forms an easy method of gation, is best effected at this time, and ugh the operation may also be carried n the spring better results usually follow mn division. Propagation can also be ted from seeds, but the method is rather

e Dodecatheons make excellent subjects ot plants for use in the Alpine-house, and his purpose the roots should be potted in 4-inch pots so early as practicable in the autumn, plunged in an ash bed in a sheltered position, and left till growth becomes active, when they may be transferred to the Alpine-house, where they make interesting objects during the spring months. W. AUTON.

Spring-flowering Sisyrinchium

ON March 8th, last year, a cousin brought me an offering from her garden—a bunch of the early flowering Sisyrinchium grandiflorum, and I was so charmed with its beauty, grace, and daintiness, that I sent the bunch to be photographed, in the hope that I might some time send it to GARDENING ILLUSTRATED, with some desultory remarks on my experience of the plant. I am most anxious to know how and why this little gem of spring flowers is unknown, or, at least, is so little grown in this country, especially in this age of the cult of the rock garden, when plants are sought for far and wide. I believe this graceful darling hails from Virginia, or one of the North-West States of America, and that it made its way over to the west coast of Ireland, near some of the harbours on the coast, probably seeds carried in the cargoes of some ships, or by some of the crew. I have had this plant for many years, given to me by an old friend, in whose garden, in Co. Down, there were regular clumps of it at each side of the centre walk in her old-fashioned garden. This friend originally got her roots from her father's garden, situated near Larne, in Co. Antrim. Except for these plants, I have never seen the Sisyrinchium in any garden, nor have I ever heard any one speak of the plant. I sent some blossoms to the courteous Curator of the Glasnevin Gardens, near Dublin, and he gave me its correct name (we had always called it the "Purple Snowdrop"), and said it seemed to be grown in very few gardens, or that it was not very common in gardens. Last year I made a collection of Sisyrinchiums, getting plants wherever I saw them catalogued by nurserymen, or from friends, but every one of these varieties flowered in June, July, and August. They had pretty little blossoms, blue, blue and white, and pale purple, one larger-flowered yellow one. But I must say they are a plebeian lot when compared with the grandiflorum! I shall now try and describe its charms. The colouring of the blooms, which are in shape like the Snowdrops which bloom a little earlier, as a rule, and are larger than the well-known and well-loved white "first born of the world's delight, pride of the dewy glade," is of a pale purple, tinged with pink, so pure, and almost pellucid, the texture of the petals is almost transparent, reminding one of some rare porcelain, with a peculiar gloss like that of satin. The foliage is rushlike, very scanty; nearly every spike has one, two, or three blooms on it, and the spikes grow about 10 inches or 12 inches high. The roots are like the common Rush roots. I did not know until last year that there is a white variety of the grandiflorum. I learnt this from a photograph in GARDENING ILLUSTRATED. Two blooms were shown by Messrs. Tucker, Ltd. When I saw them I set my heart upon getting some plants, and shortly afterwards I saw a short note from "Stormonth, Kirkbride, Carlisle," about this white variety, and when I wrote about it I found Messrs. Stormonth had a large nursery near Carlisle, and had both varieties of this spring-flowering Sisyrinchium in their catalogue. I got some plants, and have since been the means of distributing other plants from them to friends. I believe this white variety is even more beautiful, the lustre on the flower petals resembling the gloss on the inside of an oyster shell. Mine has not yet bloomed this spring.

Sisyrinchium grandiflorum, sometimes known as the Purple Snowdrop

These plants are quite hardy, and do not require any special treatment, just good garden soil, and a slightly shady and fairly moist situation.

I am aware that my experience of gardens in England and Scotland may be somewhat limited, and I may be mistaken in thinking that this dear flower is not better known. I do know that I never yet have met a cultivator of it, or anyone who had ever heard of it. I write this short account of it, hoping that my notes may induce many garden lovers and owners of rock gardens to add this very choice and charming floral treasure to their store. NIN-NIN.

Gardenias

It was very pleasant to me to read in a recent issue of other growers of these lovely flowers. It is the greatest wonder that they have fallen from their once great popularity, for I find that everyone who comes in contact with them for the first time is enchanted with their lovely blooms and perfume.

I commenced growing them seven years ago, and they have done well, with the exception of four seasons ago. At that time our water supply was scrapped in favour of the Council supply, which I soon found was very hard. The plants produced "white leaves," and soon presented a miserable condition.

I soon reverted to our own supply of water and made provision for the storage of all rainwater from the houses. Now they receive nothing but rainwater. They soon came back to their former healthy state, and during the growing period produce leaves like Laurels.

I have been led to describe their wants as heat, peat, and moisture, and their dislikes to lime in any form.

The cutting of the flowers is all the pruning that they receive, and that, I find, gives them a more perpetual flowering habit, for it is rarely that I cannot cut some flowers.

I root a fresh batch annually. These, incidentally, are the growths that are cut with the flowers and have been used for decoration; they root readily. I keep plants up to three or four years, and only discard them when they become exhausted and ungainly. With me their only pest is scale, which I keep in check by occasionally spraying with Volck, which gives the foliage a lovely appearance. I also give weak liquid cow manure water and dustings on the pot of Clay's Fertiliser. G. J. MILLER.

Welwyn, Herts.

Soil mixtures for the scree

THE question of soil mixtures must always be one of interest to growers of the higher Alpines, and I was glad to hear an eminent constructional gardener declare the other day that, in making screes and moraines, he still keeps to the simple mixture of one part of leaf-mould to every six of stone chippings, without the addition of any loam, the latter being too unreliable and apt to contain a proportion of clay in many districts. I have before me several recent articles on moraine construction, and notice that all recommend loam, leaf-mould, sand, and sometimes peat in varying proportions. But in natural scree, beyond the presence of powdered rock the only soil is often supplied by the decayed vegetable matter of preceding generations of plants, and so we work back to Farrer's formula of one sixth of soil (half leaf-mould, half sand) to five sixths of fine chips. This mixture has stood the test of time as, some 20 years after it was constructed by Farrer, plants still flourish in the scree at Ingleborough.

What really seems the one essential is the addition of sufficient humus to the stone chips, and then, always provided free drainage and a dry collar in winter, and adequate moisture during the growing season are assured, a great deal of latitude can be allowed. This is illustrated in Mr. Millard's amazingly beautiful garden described in the R.H.S. Journal, where the scree consists of half stone chips and the other half of leaf-mould, peat, and good garden soil in equal proportions. Here many of the difficult plants may be found flourishing, but probably unless you are sure of your soil simple mixtures are best, and the writer claims quite a modicum of success for the simplest—leaf-mould and stone chips. F. H. FISHER.

Farrer's scree in the Old Garden, Ingleborough, 1929

Hardy Cyclamen

I have been much interested in your articles on hardy Cyclamen. I see that you state in your issue of January 12th that a soil which is retentive of moisture is fatal. The soil here is the heaviest clay, but the pink autumn Cyclamen, which I suppose to be neapolitanum seeds itself like a weed everywhere, choking everything in rockeries or borders if undisturbed, and coming up, even in rough grass. The first corms were planted in 1882. C. Coum, introduced, perhaps, 10 or 15 years ago, begins to do the same.

In autumn there are sheets of the pink and the white neapolitanum at the base of some old Elms.

I have also been interested in reading several articles about the Barberry, so lovely in the autumn with its branches of coral fruit.

There are bushes in this neighbourhood which produce the fruit without pips, and this makes the most excellent preserve. My father took cuttings and suckers from these bushes, but never succeeded in producing a bush whose fruit was without pips.

ALICE CLARK.

Millfield, Street, Somerset.

Growing Alpines in ashes

Anyone who uses an ash plunging-bed for growing Alpines in pots will have noticed the ready way in which the plants push their roots through the drainage holes of the pots into the ashes below, and will also know, to his cost, the aptitude weeds have for seeding themselves in the porous ashes of the bed.

It may be an experiment of interest for readers to try some of the more difficult Campanulas, Saxifrages, and Gentians as the writer has done in such a bed, to which old sifted leaf-mould has been added, say, in the proportion of six parts of ashes to one of leaf-mould.

Here is a cheap and satisfactory alternative to the scree, with perfect drainage and moisture-retaining properties in dry periods. It need hardly be said that the sifted ashes must be exposed to the weather for a period to wash away all traces of sulphur.

The bed may be made 18 inches deep, and, if thought desirable, finished off with a top-dressing of granite or limestone chippings, and thus assist still further the retention of moisture in the summer and prevent damage to the plants during winter rains.

That wild flowers, especially those of the hills, appreciate this root medium can be seen by the traveller as he sits in the train on his way to or from Scotland, for instance. In Yorkshire, Westmorland, and Cumberland, more perhaps than in the south, the railway banks in July are a blaze of colour with Campanula rotundifolia, C. latifolia, Primula farinosa (the haunts of these two latter plants are restricted), wild Thyme, Heaths, Willow Herb, which turns the slag dumps of Wigan into a sea of pink, several varieties of Orchis, and many other flowers.

If we examine the soil in which these plants are flourishing we find that in many cases it is largely composed of fine ashes ejected from the chimneys of engines. In some spots the deposit of these cinders approximates half an inch a year, and at the risk of interesting but few readers it may be added that from calculations made an en of a heavy freight train may make and as much as $3\frac{1}{2}$ cwts., approximating 35 c feet of smoke-box cinders in a 100-mile r

So here we have our wild plants profi from the by-products of a mechanical for will anyone deny that for sheer var and effect, with colours spilt out by Mo Nature with a lavish hand, but always wholly delightful results, our railway ba hold the supreme place among Engla wild gardens. F. H. FISHE

Carnations

For the beginner

The Carnation for winter flowering i much a regular crop in these days as is Chrysanthemum, and in both these the v of good and medium blooms is as distin marked. To leave the cuttings of "Car." in a propagating case for any preciable time after it is rooted is to c promise its whole future. While the cut is rooting it makes no top growth—m time and so comes to no harm; but imm ately there is a root to feed it growth beg and is so rapid that it affects the tissue endangers health. So then, if a healthy s is to be raised the cutting must quickl potted, upon which there is another ch which prevents growth until a new sta made by the root. But though growth is apparent, consolidation takes place and future of the plant, if not determined, i fluenced by those few days.

From the time the root begins to wor the soil all forms of coddling must be ta The Carnation is not a hothouse plant, nei is it even a greenhouse plant, but it is that answers best to purely natural c tions. The nearer we can get to natural ditions for our young plants the stronge they likely to grow and the better will b quality of their blooms.

But while we rule out everything savours of coddling, we do not mean to out sane, healthy nursing, for the "C is not so different from everything else require no nursing when young. Reaso experience amply prove that, and thoug first stage must be one of careful nursing conditions soon relax and the plantlets brought, step by step, to those that are natural.

The fact that nearly all cuttings com of a warm bed suggests that their first should be into warmed soil, for if by oversight or carelessness a cold soil is a chill, more or less, is almost certain. should there be a chill when it might so be avoided?

The compost used should be one ma of loam, leaf-mould, and sand; no strong in the way of food, for the obj is to produce and develop roots rather head growth. For the first fortnigh young stock should be kept in the propag house or one with a similar temper after which, if actually started to grow should be placed in a temperature se degrees lower. HORT

Aubrietias

We owe a good deal to the Aubrieti the bright display they make on gr and in odd corners in the garden, but I m times think we view them in the lig rock plants, and forget how useful the when used as edging plants. When within proper limits they give to a gar very pretty appearance in spring wh employed, but need dividing every two or else they make huge clumps or cush

The Pollination of Fruit Trees

Varieties to plant together

he course of a paper on " The Study of rder of Flowering and Pollination of Blossoms Applied to Commercial Fruit- ng," before the Royal Society of Arts, ecil H. Hooper, F.L.S., of Wye, Kent, me interesting information to impart Apples and Pears. He pointed out large number of the varieties would ature fruit when pollinated by pollen e same variety, being self-sterile gh many are self-fruitful) and re- to be pollinated with other varieties. ng of Pears, Mr. Hooper said: " In n experiments I have found the fol- varieties more or less self-fruitful:— ence, Dr. Jules Guyot, Chalk, Beurré nlis, Swan's Egg, Colmar d'Eté, sse d'Angoulême, Marguerite Marillat, Windsor, Jargonelle, Souvenir du ès, Beurré Jean van Geert, Beurré Durondeau, Petite Marguerite, Blick- and Glou Morceau. Only one fruit ach has matured with me out of many with Pitmaston, Williams, and né du Comice. No fruit has been ob- by me with own pollen from Clapp's rite, Fertility, Eile d'Heyst, or Catillac. l observations in successful and un- sful Pear plantations might yield many and suggestions which might be d by pollination trials. Among suc- pollination results were:—Clapp's rite with Conference, Dr. Jules Guyot Clapp's Favourite, Roosevelt, Fertility Conference, Durondeau with Fertility, l Todleben with Conference, Vicar of ield with Winter Cresanne, Williams' Chrêtien with Clapp's Favourite, Win- esanne or Fertility, Pitmaston with ence or Williams' Bon Chrêtien, le's St. Germain with Marie Louise, c with Fertility or Uvedale's St. in."

ning to Apples, Mr. Hooper was even emphatic. " Although a considerable tion of Apples is gradually being to be more or less self-fruitful (under varying from 7 per cent. down to 0·2 nt.), yet all experimenters agree that gle variety can be advantageously d alone and that all varieties yield if interplanted with one or more varie- flower at the same time. Even the self-fruitful variety will yield three or mes the crop with other varieties than ted alone. Among the varieties found self-fruitful are:—Stirling Castle, Rev. Wilks, Golden Spire, Irish Peach, mas Pearmain, Beaumann's Red Win- einette, Ben's Red, Miller's Seedling, Derby, White Transparent, and Tower mis, but with many trials I have never ded Cox's Orange or Lane's Prince to mature fruit with their own s."

here a variety has been planted alone ck it is recommended to re-graft or e one tree in eight with a different flowering about the same time. ey's Seedling is found to be a specially variety with which to re-graft. Each tree in each third row of a different y is considered the minimum propor- or a pollenising variety. In planting a rchard it is advisable to plant not more two or three rows of one variety and alternate with another variety."

xperience and experiment show the ing to be good varieties to plant to- , though other combinations may suc- equally well:—Cox's Orange with ester, Bramley with Lane's, Newton Lord Derby, Blenheim with Newton, Early Victoria with Grenadier, Beauty of Bath with Allington, James Grieve with Cox's Orange, Gladstone with Cox's Orange or Worcester. In many trials I have found Cox's Orange to be a good polleniser; the crosses have almost always taken and matured fruit."

Apple High View Pippin

IN February, 1925, I sent you three fruits of Apple High View Pippin (Sturmer Pippin x Cox's Orange Pippin), of which you then gave a good opinion. In January, 1928, I sent a dish of fruit to the Royal Horticultural Society's Fruit Committee, and received an Award of Merit for it. I am now sending you four fruits, two from the seedling tree and two gathered from a tree on Paradise stock. I think you will agree with me that the size of the fruit has improved. I had fruits last year in good condition till April.

F. FITZWATER.

The Gardens, High View,
Oatlands Drive, Weybridge, Surrey.

[We congratulate our correspondent on his success, and endorse all we have said in praise of this new seedling (see GARDENING ILLUSTRATED, February 28th, 1925, page 138). High View Pippin is a beautiful golden-russet Apple of rich, almost aromatic, flavour. As a February dessert Apple we know of nothing better, or even so good.—ED.]

Fruit tree planting

A few things, in brief, which all who receive fruit trees from the nursery should always attend to are:—First, soaking the roots in water for an hour or two, as they will almost invariably arrive rather dry. So soon as partially dried go over the roots with a sharp knife and cut off bruised ends, or pare off bruises anywhere about them. Next, have all holes for the reception of the trees ready for immediate planting. These should be made after the soil has been deeply broken up and well pulverised. Each hole should be fully a foot broader than the spread of the tree roots. It should be shallow rather than deep. Roots will naturally go deep, and it is well at the outset to keep them fairly near the surface, as when needing manure it is best applied in the form of mulching. Spread the roots out evenly, fill in about them first with fine soil, then coarser, and gently tread it firm. Put a temporary stake to each tree.

Pear Beurre Diel

This Pear has been grown extensively since its introduction, and is still to be found in many gardens. Opinions are varied as to its merits, some holding that it is not far removed from first-class, others that it is coarse and gritty, and not inclined to ripen satisfactorily, the truth being that it is a Pear that varies considerably under different conditions, and at its best a good paying fruit. There is a tree on the south end of some farm buildings near here that has been planted about 40 years that covers some 200 square feet, from which the owner seldom fails to secure a crop, and this year he will pick close on a bushel of fine fruit which presently will command a good price at the local shops. Our soil suits Pears well, being a friable loam a little on the heavy side, overlying clay at a considerable depth, and the drainage is, naturally, good; the tree is also helped with a good annual top-dressing. In an orchard on the same farm I came across a standard Pear I had not seen for years, the old red Sanquinolle, of little account to eat in a raw state, but a handsome and tasty dish in stewed form.

Hardwick. E. BURRELL.

The Colours of Flowers

THOSE fortunate people who were blessed with a country childhood may remember searching the meadows for the odd white Orchis amidst the host of purple, or the scattered clusters of "pink-bells" or "whitebells" in the blue carpet of the spring woodlands.

Variability in flower colour within the species is common, but it is more especially common in the case of the bluish, purple, and crimson shades, much rarer in the yellow and orange types. The Milkwort and the Buttercup may be taken as extreme examples from the British flora.

This difference coincides very closely with chemical and physical differences in the pigments concerned. The yellow and orange carotin and xanthophylls are present as solid granules, the blue to red anthocyanins are usually, but not invariably, dissolved in the sap.

The variation may be hereditary, as in the white Orchis and Bluebell, or it may be correlated with environmental factors of often unknown nature, and it is this latter class which the gardener curses and Madame Gossip softly slanders.

It is, however, often hard to disentangle the two types, and both may combine together with—very rarely we will say, lest we raise more strife—the nurseryman's excessive eloquence to bring about the poor gardener's disillusionment.

In some few cases we do know a little about the factors concerned. The Hydrangea is a case in point.

Some few years ago a Dublin botanist demonstrated that the pink colour became blue if the sap contained a sufficient quantity of iron compounds, the interesting point being that the plant might be growing in a soil rich in iron, and yet still bear pink flowers. This is owing to the very limited "availability" of iron in a neutral or alkaline soil. In such cases the addition of alum or other aluminium salt, by rendering the soil acid, enables the plant to draw more freely on the iron therein and the fond cultivator to rejoice at his success in "blueing his hydrangeas."

Fired by similar theories, the writer planted batches of Meconopsis rudis in habitats varying from pure damp peat to a dry limestone scree (these in the latter situation should have died, but did not), and in every case the flowers were a beautiful blue. This was in Derbyshire. Yet plants from the same packet of seed removed to East Anglia and planted in an apparently ideal Meconopsis soil, in half-shade as well as full sun, produced more mauves and dull lilacs than blue!

There, at any rate, the carbonate content, or PH (acidity or alkalinity), of the soil was not the deciding factor.

The much-discussed M. betonicifolia (in the last few weeks Mr. Taylor, of the British Museum, has definitely sunk M. Baileyi into this species) may also vary—and to horrid dinges at that, as I know from experience, be it limited—irrespective of soil conditions, and, for that matter, without respect of persons. Recently Madame Gossip was telling of two famous Cambridge botanists sharing a batch. One's plant finally proved all blue-flowered, the other had more plants, but ne'er a single really blue flower!

We *do* like to grow M. betonicifolia whatever its colour, but we like the blue ones best.

Others of the genus, such as M. Wallichii and M. Pratti, vary in the same at present rather incomprehensible manner.

I shall never forget my first sight of the
Columbine as a wild plant on the s
slope of a Derbyshire dale, its pure bl
a revelation and an unexpected delight
accustomed only to the white and s
plum shades of the Aquilegia vulga
cottage gardens. A year later I saw
soil of a similar lime and organic con
an East Anglian fen, and the flower
dull purplish!

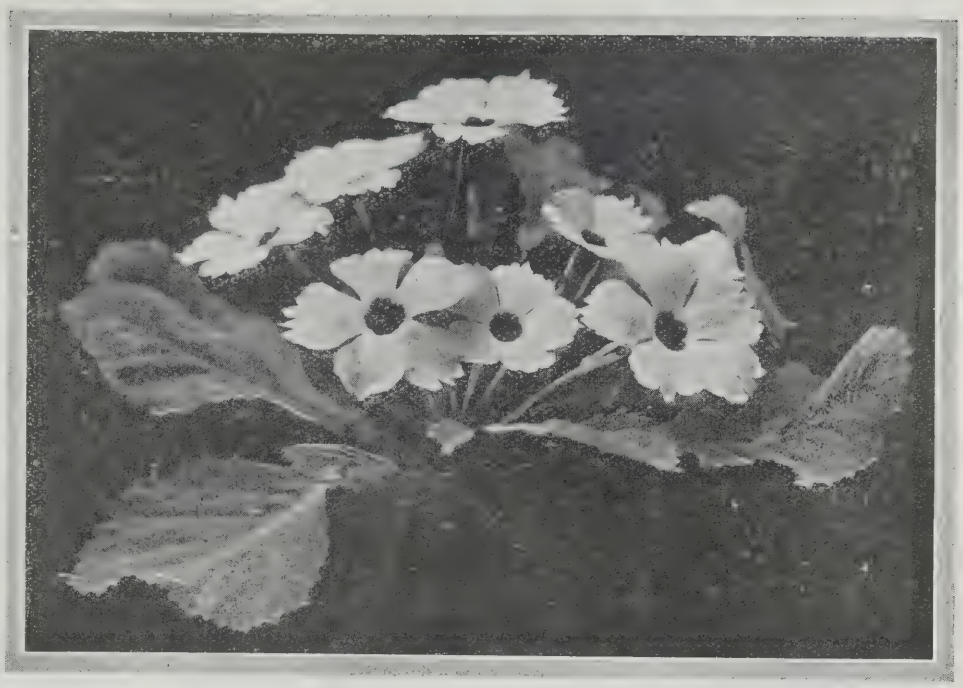
VEGETABLES

The Jerusalem Artichoke

HIS, a member of the Sunflower family,
s not looked on with favour by many
eople, yet it is productive of whole-
roots which form an acceptable dish
the number of vegetables available is
cted. On the Continent it is more
dy used than in this country, being largely
for thick soups and also baked, when
avour is much richer and better.

roduced from North America somewhat
than the Potato was introduced from
America, it was in earlier years re-
mended as a substitute for the Potato.
well worthy of extended culture, and is
inly one of the most accommodating
grown, for it will thrive in almost any
of soil and is by no means fastidious as
tuation. Nevertheless, like all other
ables, it will yield a much finer crop of
s when it is planted in reasonably good
and enjoys a full share of light and air.
common practice of forming a plantation
and allowing it to remain for an indefinite period is not to be recommended as, by so doing, it is impossible to obtain tubers of serviceable size.



Primula Winteri

The Jerusalem Artichoke possesses an advantage in that it is quite hardy, thus enabling early planting to be practised without fear of check from spring frosts; indeed, early planting is to be recommended, and although the actual time must be determined by the state of the soil, it should not be deferred longer than is really necessary after February. Ground which has been well prepared in the autumn and left rough during the winter breaks down to a fine tilth after this weathering, and enables planting to proceed under ideal conditions.

The most suitable tubers for planting are those about the size of a hen's egg, but if there is not a sufficient supply of these, larger tubers may be cut. As it is necessary to allow a sufficient amount of space for the development of the stems and foliage, plant them in rows at least 30 inches apart and the tubers 12 inches or 15 inches from each other. The tubers may be planted in drills about 5 inches in depth or dibbled in, but, as is the case with the Potato, more satisfactory results may be expected from those planted with the spade, especially if the soil is of a tenacious character.

Little attention will be required during the growing season beyond frequent hoeing of the plantation, and towards the end of the summer the tubers increase in size rapidly, being ready for use from November onwards. As they are not in the least injured by frost the tubers may be left in the ground, where they keep best, till wanted for use. A portion of the crop may be taken up and stored to ensure a supply during frosty weather, but if a few rows are covered with Bracken or dry leaves this usually admits of the tubers being obtained, even in severe weather, without much difficulty.

Although the Artichoke is a very variable plant when grown from seed, much less has been done in its development than is the case with most other kinds of vegetables. This is, probably, largely due to the fact that the plant does not seed freely in northern latitudes, thus making it very difficult to make numerous and repeated sowings.

The old purple variety and the newer improved white variety are usually grown in this country, but Messrs. Vilmorin, Andrieux, et Cie. have raised several varieties, one known as Patate having long, yellow tubers, and another called Spindle, with shapely fusiform tubers. While the yield of the latter is considerably lower than that of our improved white variety, the percentage of sugar in the tubers is much higher. It would appear, therefore, that the raising of varieties of superior food value is possible of attainment, and this has interest also from an industrial point of view as a possible source of alcohol.

W. AUTON.

Protecting vegetables from frost

Care will now have to be taken that Lettuce and Endive which are being preserved in frames are not injured by frost, as where these are of fairly large size decay sets in very rapidly if frost is allowed to reach them. In the case of severe weather the lights should have a thick covering of litter or Bracken placed upon them, and if the frost continues, allow it to remain on until this has passed away. The sides of the frames will also have to have some litter placed around. On the other hand, ventilation will have to be attended to on all fine days. Cauliflowers will also need protecting, but these must not be unduly coddled. Parsley will also require attention. Once let Parsley become injured by a severe frost or beaten down by snow, decay will rapidly set in. It must not upon any account be coddled, a free circulation of air being essential during damp or mild weather. Protection from frost and snow and a free circulation of air at other times are essential.

Broad Beans amongst other crops

Beans are not a very important crop, as many do not care for them more than once or twice in the season, but few gardens should be without them, and in some they appear to be grown largely; but whether in large or small quantities, I would never grow them by themselves, but amongst other things, as an extra crop. In many cottage gardens, where much has always to be made of small space, it is a favourite way of growing Broad

Beans to place the seeds here and there amongst Potatoes, and no better place could be found for them, but amongst Potatoes is not the only place in which they may be grown. Amongst Onions, Carrots, Parsnips, and even amongst Cabbages, Broccoli, and such like they also grow and do well. The seeds may be put in singly, 2 yards or more apart, amongst any or all of these crops, and they will grow up and bear finer pods than ever they would do crowded together in rows by themselves. M.

Sow Parsley for early use

Where this herb is in constant demand there is sometimes considerable difficulty in keeping up the supply, as the old plants soon run to seed when warm weather comes, while those raised by sowing seeds out-of-doors in early spring take a long time to reach the useful stage. By sowing a pinch of seed now, in a little warmth, pricking off the seedlings when fit to handle into boxes of good soil, fine plants will be obtained that may be planted out early in May, and these will in a short time furnish first-rate leaves in abundance, and will continue to do so for a long time.

Plants of Special Interest at Vincent Square

THE illustrations on the page opposite portray some of the plants of interest seen at the R.H.S. fortnightly show on February 12th. It was a very bright show in spite of the severe wintry weather. The large groups of Cinerarias from Mr. Samuel Walbrook, The Manor House, Stanmore, Middlesex, and from Sutton and Sons were the source of admiration. There were also good displays of Carnations and a group of early Tulips, also collections of well-kept Apples. Following are brief descriptions of the plants illustrated :—

(1) The first illustration is of a spike of the Dendrobium delicatum. A plant of this rare species carrying 20 spikes of small, pure white flowers was shown by Mr. S. G. Brown, of Shepperton, for which Mr. F. W. Thurgood, the gardener, gained a Cultural Commendation for an unusually fine specimen.

(2) IRIS SIND-PERS.—This delightful early-flowering hybrid (I. sindjarensis x persica) was shown by Messrs. Cutbush, and it was also noted on other exhibits. It is free-flowering and an easy doer. The flowers are pale mauve with a flash of golden-orange on the fall, and it is one of the most beautiful of all bulbous Irises.

(3) EARLY-FLOWERING DAFFODILS. — Mrs. Bucknall brought from her favoured garden at Creagh Castle, Doneraile, Co. Cork, a large bunch of a welcome little Daffodil that had for weeks been flowering freely in the open without protection—but this, it should be pointed out, is in south-west, a favoured part, of Ireland. This precocious seedling has been shown before, but previously too early in the year for the Daffodil Committee. The seedling in question is earlier than N. pallidus præcox. It is a small yellow self not unlike N. minor, from which it is probably descended, though its parentage is unknown.

(4) GORDONIA LASIANTHUS.—An Award of Merit, subject to revision of name, was granted to this tender shrub, which is seldom seen in flower. Shown by Lt.-Col. Messel (gardener, Mr. J. Comber), Nymans, Handcross, Sussex. It is a North American evergreen shrub requiring greenhouse treatment. The cup-shaped flowers are white, not unlike single Camellias, to which genus it is closely related.

(5) MILTONIA LYCÆNA ORCHIDHURST VARIETY.—First-class Certificate. The most outstanding flower in the show. The blooms of this remarkable Miltonia were 4 inches across and of a rich ruby-red, edged white. Shown by Baron Bruno Schröder, Dell Park, Englefield Green.

(6) DWARF RHODODENDRON K.W. 6273.—Award of Merit. A young seedling plant about 1 foot high was shown by Mr. Lionel de Rothschild (gardener, Mr. A. Bedford), Exbury, Southampton. The flowers, borne in pairs, are large for the size of the plant, slightly fragrant, and have dark chocolate-coloured anthers. It was raised from seed collected in the Tsangpo Gorge by Capt. Kingdon Ward. H. C.

Sowing seeds under glass

WITH the advent of a new year we are reminded that to make a success with many an annual blooming from early summer onwards an early start is imperative. One must have a mean temperature of about 60 degs.—a little more or less in keeping with outside conditions need not hinder the sowing of many of our choicest greenhouse plants, some of which require rather a long time to reach the flowering stage, notably, Begonias, Gloxinias, and Streptocarpus.

Glass accommodation is only one of the necessities for producing young plants of a healthy nature; we must have a suitable compost, clean pans, and drainage, as well as a convenient shelf within a foot or so of the glass roof, immediately the seedlings are through the soil, as a preventative against elongation or decay by damping.

Shallow pans or even boxes a foot in length are far preferable to the ordinary flower-pot, which is, as a rule, too deep for tiny seeds such as enumerated above, and a compost of about equal parts loam and leaf-soil passed through a fine sieve, with a good percentage of clean, fine sand to ensure efficient drainage when water has to be given, with ample bottom drainage, evenly placed with a little Moss or half-decayed leaves as a preventative of the finer mixture getting among the crocks. Fill the receptacles within ¼ inch of the top, pressing moderately firm and leaving an even surface and stand them in 3 inches or so of water so that the soil becomes moist to the top. This should be continued whenever moisture is required, an old galvanised bath being very suitable for such a purpose. Let them drain for an hour, then sow the tiny seeds thinly, barely covering with a little fine silver sand. Thick sowing leads to "fogging off" during dull or foggy weather. Further, when sown thus the tiny plants make quicker progress and do not need pricking off so soon.

As regards covering the seeds, such as Salvias, Dahlias, Lobelia, Antirrhinums, Clarkias, Godetias, and Sweet Peas, one must be guided by the size of seed and cover accordingly, neither of which must be subjected to too much heat or coddled in any way. All excepting the Antirrhinums make capital pot plants for greenhouse or conservatory.

The pricking off of tiny seedlings requires much care and patience so as not to bruise them with the dibber. A similar soil suits most of them. A little fine peat may be added to Gloxinias and Streptocarpus. Careful watering and a light shade during bright weather and careful ventilation, guarding against the cutting winds of early spring, are necessary.

Turning our attention to the vegetable garden, there are several things that one can forward by several weeks if one has a glass structure where hard frost can be kept out, and by covering the seed pans or boxes with
mats or similar material even an ord
frame may be used to good account
tended to in this respect. Such thin
Peas, Broad Beans, Lettuce, Caulifl
Cabbage, Leeks, and Onions, all of
grow more sturdily without artificial he

The preparation for the seed may b
same as for the warmer subjects menti
Here, again, the advice stands good

NEW AND INTERESTING PLANTS SEEN AT VINCENT SQUARE ON FEBRUARY 12th

1. Dendrobium delicatum, with numerous small white flowers.
2. Iris Sind-pers, one of the most beautiful of all bulbous Irises.
3. An early self yellow Daffodil from Creagh Castle, Ireland.
4. Gordonia Lasianthus, seldom seen in flower.
5. The splendid Miltonia Lycæna Orchidhurst Variety, rich ruby-red.
6. Rhododendron K.W. 6273, a dwarf Chinese species.

REMINDERS FOR THE WEEK

Southern and Midland

Chrysanthemums

Many of those rooted early in the year will be ready for a shift into larger pots, and this must be attended to before the little plants become potbound. Especially does this apply to those varieties which are intended to produce large flowers. A good, rich, loamy compost should be used, consisting of maiden loam three parts, and one part sweet but well-decayed leaf-mould and sharp sand. A cool, low house or cold frame will be found very suitable for such plants from this date, providing it can be rendered frost-proof, and when growth is seen to be free the amount of air should be increased, otherwise the plants will grow too soft and luxuriant.

Border Chrysanthemums

Insert cuttings of these useful varieties as fast as such become available. These may be struck either in a cool or heated frame, the latter usually being resorted to only when very large numbers have to be propagated. A little shade may be necessary during sunny hours, and a light dewing of the foliage once each day will maintain the cuttings in a fresh condition and assist root-action. Some varieties are shy in producing cuttings, and where doubt exists as to the required number being produced the old plants should be divided up and placed in a warm, moist frame to encourage growth.

Zonal and other Pelargoniums

These will now be throwing quantities of flower-spikes, and will derive much benefit from weak applications of liquid-manure, moisture, and warmth—especially from sun-heat—may with advantage be increased, and where it is advisable to add to any particular variety a few cuttings may be inserted at the present time.

Poinsettia pulcherrima

Place the old stools in heat where they may be sprayed daily to encourage the development of sturdy cuttings, which may be inserted in sandy soil when about 3 inches in length. The roots of the stools should be kept upon the dry side until growth is again active, otherwise there is a tendency for these to decay.

Perpetual and Malmaison Carnations

From this date a little artificial manure may be applied to these plants with advantage either in a liquid state or dusted over the surface of the soil. The temperature may also be permitted to rise considerably during hours of sunshine, but no difference must be permitted with night temperatures. Air may be given more freely on the sheltered sides of the houses, and staking of the plants must no longer be delayed.

Bedding plants

Push forward the propagation of these, also a variety of plants needed for the maintenance of conservatories and greenhouses during summer, such as Coleus, Fuchsias, Lantanas, Cannas, by means of suckers, Salvias, Statice, Acacias, and other ornamental subjects.

Sow seeds

The following should now be freely sown in a temperature of 55 degs. to 65 degs.:—Aquilegias, not omitting some of the beautiful species, such as A. cœrulea, A. glandulosa, and A. Skinneri; also Pentstemons, Antirrhinums, Petunias, Verbena Rose Queen (a very beautiful variety), Chelone barbata and its varieties, Scabiosa caucasica, Evening Primroses, Lobelias, and Lilies, of which a large variety is available and most of which may be relied upon to germinate freely. Well-drained pans of sandy soil should be used.

Peaches and Nectarines

When growing in the open these should now be sprayed with "Medela" to prevent the devastating effects of Leaf Curl, as trees badly affected lose half their vitality at a time when clean growth is most essential.

Strawberry beds

A light forking over of the surface soil, burying whatever is left of the manure put about the plants in the autumn, will not only improve the appearance of the beds, but, by admitting air and warmth, will prove beneficial to the plants.

Kitchen garden

On light land Jerusalem Artichokes may now be planted, but on heavy land defer this for another fortnight; also make a further sowing of Broad Beans on well-prepared land.

Parsnips

A first sowing of these may now be made. The ground should have been deeply dug and enriched early in the winter, and thus work freely now.

Peas

Make generous sowings of Peter Pan, Onward, and Little Marvel in pots, and raise in a cold house or frame. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Pot up Begonias

It is now time to remove the dormant tubers from their winter quarters and get them started into growth. Prepare a light compost, mainly of leaf-mould and sand, and place each tuber in a small pot, barely covering with the soil. Set in a temperature of about 60 degs. Keep moist, but not saturated, and growth will very soon start away. Shallow cutting-boxes may be used instead of pots where preferred, the same compost being suitable.

Potting Chrysanthemums

As cuttings of the late-flowering varieties become nicely rooted they should be potted off singly and returned to the same temperature until well established, when a cold frame will be found to be the best place for them. Cuttings may yet be secured should there be any shortage of stock.

Insert cuttings of greenhouse plants

Such things as Fuchsias, Petunias, Regal Pelargoniums, Zonal Pelargoniums, Statices, Crassulas, and many others may all be rooted readily at this time if fresh young growths are available for cuttings. Keep rather close and shade from the sun.

Pot on autumn-rooted cuttings

Young plants that have been wintered in the cutting-pots should now be shaken out and potted up singly, using fresh compost, returning to the same house or pit and giving them a little shade for a week.

Starting Dahlias

While it is a mistake to start these into growth too early it will be found that good results will follow if the old stools be now planted in shallow boxes, some leaf-mould or light compost being worked in among the roots. The shoots are sturdier if only moderate warmth be given, but the cuttings, when inserted, may, with advantage, be a little bottom heat to encourage the production of roots.

Prick off Tomatoes

As soon as the seedlings are fit to h prick off into 2-inch pots (boxes may be if preferred), using a sweet but not too compost. Shade from all sunshine week, elevating the little plants as clo possible to the roof-glass. A temperatu this stage of 65 degs. is very suitable fo plant.

Cucumbers and Melons

With the fast-lengthening days the now considerably less trouble in raising so seeds may be sown freely in accor with requirements.

The vineries

In the earliest houses the tying dow pinching of the laterals must have pe attention, while others breaking into g should be disbudded in good time. Th constant saturation of the soil is harmfu greatest care is necessary to see that time are the roots permitted to suffer dryness.

Apricots and Peaches

As these two valuable fruits open flowers early it is imperative that some of protection from frost and cold rains b vided. It is wonderful how effective fo purpose is a double ply of fruit ne Arrange in such a way as to prevent its rubbed against the flowers by the wind course, properly made blinds tilted so roll up during fine days are better, though somewhat expensive, will, with last for years.

What may be planted

Should the soil be in working order th still time for the planting of Apples, Cur Gooseberries, Pears, Plums, and berries, but on no account attempt this when the soil is either sodden with sn rain, or hard with frost.

Get pruning and nailing finished

While all fruit trees and bushes may pruned it is advisable to have such finished at the earliest opportunity, fo sap is beginning to rise and buds are so knocked off after they begin to swell.

Other things to plant

Roses, most hardy shrubs, hardy pere (herbaceous), hardy climbing plants, edges, hedge plants, and suchlike may taken in hand during suitable weather. bulk of rock garden plants may also be without damage at this season.

Raising Aquilegias

This delightful hardy plant does no kindly to division of the roots, but tunately, it is easily raised from seeds these should be sown now in pans or bo good, sweet compost and set in a greenh There are numerous high-class strains market. The plant is not, nowadays, a liver, so it is well to raise fresh stock y

The modern Polyanthus

Few hardy plants have been so wond improved of recent years as has this spring-flowering subject. Though it c readily increased by division it is a fact seedlings produce by far the finest flow it is well to raise a number yearly i way, and by sowing now in gentle w very much finer plants are got than wh sowing is made in the open garden. a good strain, it being just as easy to as a poor one. Preston House Gardens, Linlithgow.

BULBOPHYLLUM LOBBII

Upper flower (one sepal removed) showing lip in normal position in
diness for an insect. The pedestal and foot of column also
own. The lip is hinged and a slight touch will set it in oscillation.

Flowers showing the labellums overbalanced as they would be were a fly between them and the column faces. The upper flower shows the pedestal and the point of lip movement.

Bulbophyllums and their Allies

One of the distinguishing features of the Order Orchidacæ is that in all species the third petal, the lip (labellum), is more or less specialised to attract and guide some particular insect species to fertilise the flower, in many cases such specialisation preventing the entrance of less favoured insects, though to them the flower may have attractions.

) a great extent each genus has its own
eculiar modification of the lip, but cer-
ain genera appear to have adopted practi-
the same means, or general formation,
tain the desired end. Thus, under the
ion name Cypripedium, four distinct
id families have evolved a similar lip
cter, that of a slipper or cup, which, by
ape, facilitates the entrance of certain
s, but ensures their departure by other
ges, in passing through which the re-
ment of the pollinia is ensured.

lip structure is even more remarkable
lbophyllum, Cirrhopetalum, and Mega-
m. From the foot of the column—the
ure which carries the stigma and pollen
produced a short, sturdy pedestal, on
the labellum is hinged so delicately
a breath of air or a slight touch to the
r will, in many species, set it in oscilla-

the majority of the three genera the lip
gue-shaped and arched, with the point
ward. On an insect crawling or alight-
n the lip and going beyond the centre
uipoise, overbalance is caused, and the
finds itself precipitated head down-
s, its legs still clasping, or on, the lip,
its back against the column. In
gling to regain a more comfortable posi-
it removes the pollinia, which adheres,
ly, to the back of the thorax. Escaping
the flower and visiting a second, the
goes through the same gyrations, but
s the pollen from the first on the stigma
of the second flower, in turn removing and carrying off a second set of pollen masses.

The insect is the unconscious means by which the flower is fertilised. Hybridity is practically prevented by the fact that no two species are quite alike in size and structure, so that probably only one or a very few kinds of insects are of the right size to enter and escape from the flowers of a particular species. Too large an insect, and the lip overbalances, preventing entrance to the flower and access to the pollen. Too small, and the insect could crawl in and out without disturbing the lip balance.

In Cirrhopetalum, a name derived from cirrhos, a tendril, and petalon, a flower-leaf, not only does the lip oscillate, but the two lateral sepals are greatly enlarged, lengthened, and twisted completely over, so that what were originally the under-surfaces are now uppermost, and the outer edges become the inner.

In the majority of species these two (really the outer) edges are confluent for the greater part of their length. Often they diverge at their tips, but apart from this divergence an opening is usually present basally. This opening allows free movement to the lip. Its origin may be readily seen if the two lower sepals of a Cattleya, or even a Lily, be twisted over. The twisting process produces an orifice basally. Without actually cutting, tearing, or causing the segments to overlap, the two outer margins cannot be made to touch at their bases.

In some instances, however, Nature has an alternative or remedy. Both in this and the allied genera some species have the basal portions enlarged so that coherence is complete and a "chin" is formed in which the third petal can move, but within limits.

Support is thus gained, and undue pressure on the lip avoided.

The dividing line between Bulbophyllum and Cirrhopetalum is not very clearly defined, but, broadly speaking, it may be said that in Bulbophyllum the twist is often not completed, the presence of "chins" is more prevalent, and while the inflorescence of Cirrhopetalum assumes a more or less umbel-like character, usually unfinished, that of Bulbophyllum presents no definite character, some species producing single flowers on short, tall, erect, or lateral scapes, others a multitude of small flowers aggregated into a cone-like formation, which may droop on a short peduncle or surmount a comparatively tall, erect stalk.

In B. saurocephalum and a few allies the rachis (the flower-bearing portion of the peduncle) is swollen and the small flowers are set at intervals on the whole of the surface, sometimes partially embedded.

Though the name Bulbophyllum is taken from bulbos, a bulb, and phyllon, a leaf, in certain species pseudo-bulbs are entirely absent.

In Cirrhopetalum the lip usually assumes the shape of a tongue, and though this is a favourite form in Bulbophyllum, many members of that genus have their labellums strongly haired, so much so as to hide the real outlines.

Usually in all three genera the labellums and petals are greatly reduced, while the upper sepal is often smaller than the lateral.

In Bulbophyllum the sepals and petals are generally clean in outline, but many

Cirrhopetalums have the dorsal sepal and petals ornamented with tufts or tassels of hair.

Megaclinium, from megas, large, and kline, a bed, is distinguished from the preceding genera by the curiously flattened rachis, which is compressed into a leaf-like form and carries the flowers at regular intervals on both of its sides. Some species have the rachis set at right angles to the stems, resembling a single direction signpost, but in others the compression occurs quite low on the peduncle and assumes, or tries to assume, the form of a spiral.

The flowers are small, but the rachis is usually an additional attraction. As in Bulbophyllum the sepals are the larger organs, and in Megaclinium the dorsal sepal is usually hooded and is the larger. The flowers are so turned as to face the rachis.

The distribution of the three genera is very wide. Cirrhopetalums extend from Ceylon through all the warmer parts of the Eastern hemisphere. Bulbophyllums have practically the same range, but, in addition, a number are found in Africa and a few scattered species are met with in tropical America.

Megacliniums are confined to Africa, chiefly to the western portion; at any rate, as far as the cultivated species are known.

None of the three genera contain plants of decided decorative value, but all of them seem to possess some special feature, and are so quaint in structure or bright in colour that often attention is drawn to them before plants of greater horticultural merit are noticed.

Personal taste must decide as to which are the better worth cultivating, but once one or two have found place in an Orchid collection their fascination is such that it becomes more and more difficult to separate the so-called botanical species from those which have, at any rate, superficially greater floral attraction.

In Bulbophyllum the giants of the genus are Fletcherianum and macrobulbon. Both are natives of New Guinea and are similar in habit, with sturdy, wrinkled pseudo-bulbs, carrying a single, large, fleshy, glaucous leaf. A plant of B. Fletcherianum was shown recently by Messrs. Sanders, in which the largest leaf was 20 inches long. The single inflorescence contained 21 flowers set closely together on a short, thick peduncle. The lower sepals, some 3 inches long, are joined together on their inner edges, while their outer edges are brought upwards and inward, and are also connate through the greatest part of their length. The upper sepal is shorter, and only the tips of the petals can be seen. These, with the tongue, are of a bright crimson-red, the remainder of the flower dull red, broken with grey.

Seen in profile a flower is not unlike an eagle's beak partially open, with the upper mandible much shortened.

B. macrobulbon, awarded under the name of B. Balfourii, has smaller flowers similarly coloured, but with a yellowish ground. The segments are broadly triangular and the flowers open more widely. They have been likened to the gaping mouth of a young bird, the resemblance being heightened by the comparatively large blood-red lip.

Two illustrations on page 129 are of B. Lobbii, a species often met with in gardens, and always noticeable not for brilliant colouring, as the whole flower is in shades of fawn-yellow, but the comparatively large tongue-like lip nods at the slightest touch, and as the flowers are carried on erect stalks, are 2 inches to 3 inches across, and the sepals are incompletely twisted the movements of the lip can be seen at a glance.

In the first illustration (No. 1) a lower sepal of the upper flower has been removed, showing the lip in its normal position in readiness for an insect.

The second illustration shows a flower, also with a sepal removed, showing the lip overbalanced, the position in which it would be were an insect between its upper surface and the column face.

Both illustrations show the flowers in profile to a great extent.

Colossus, a much larger-flowered variety than the type, comes from Malaya. A wonderful specimen, was at one time in the possession of the late Mr. Walter Divided into several plants it is now common.

The pseudo-bulbs of the type are what conical, spaced at intervals on a ing rhizome, and carry a single leaf.

Dearei is very near to Lobbii, bu peduncles are shorter and the flower flushed with orange and ornamented purple streaks.

E. Coo

(To be continued.)

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish pla be named should send fair examples of eac stem, leaf, flower, or fruit. (Snippets of and points of shoots are useless.) Not more four plants should be sent in any one week same correspondent. Where more than on is sent they should be numbered. Of conife cones should always be sent.*

Naming fruit—*Several specimens in di stages of colour and size of the same kind assist in its determination. Single, unri deformed specimens are difficult to nam do not undertake to name more than varieties at one time.*

ORCHIDS

Treatment of Dendrobiums

(Regular Reader).—Unfortunately, you do not state the variety, or varieties, of your Dendrobiums, and the treatment given to different types varies in details. The following is recommended in the case of D. nobile, which, most likely, may be the particular form referred to in your query. Old plants which are in 8-inch pots or over need not be potted oftener than once in every two or three years, but they ought to be surface-dressed annually. The best time at which to repot is when the flowering period is over and when the plants are beginning to push out growths from the base of the old stems. After repotting, the plants require a moist, warm atmosphere. Pot or surface-dress with turfy peat and live Sphagnum Moss in equal parts, with a little charcoal and plenty of crocks (potsherds) among the mixture. Dead portions ought, of course, to be excised carefully. Small plants growing freely should be potted on every year.

TREES AND SHRUBS

Climbing plant for north-east wall

(W. J. O.).—For a wall with this aspect Lonicera aureo reticula, Jasminum nudiflorum (see illustration, page 118), J. officinale album, Lupinus arboreus, and Euonymus radicans variegatus can be recommended. The Clematis will succeed, but less satisfactorily than in a better position. You might try C. viticella rubra or C. viticella alba, but C. Jackmanni would, frankly, be very speculative. Some of the deciduous Magnolias occasionally do well in rather unpromising places, and one or more of these would certainly justify a trial.

Making a Heath garden

(S. W.).—Although, perhaps, Heaths grow best in peaty or boggy quarters, it is a mistake to assume that they can only be grown in such soil. As your staple includes much clay it is desirable to remove a proportion of the surface soil, say, to the depth of 6 inches or, perhaps, a little more, and to replace it with a mixture of sound loam and leaf-mould well firmed. The effects of summer drought could be minimised by surface mulching with half-decayed leaves or some similar material. Try Erica australis (which does well in rather dry places), E. carnea, E. cinerea (the Grey Heath), E. stricta, E. vagans (the C Heath), which will grow in almost ar and E. ciliaris (the Dorset Heath), w too little appreciated and which is as as any other Heath of native or of Eu origin.

Treatment of a young Beech he

(D. K.).—You would be encoura more stocky growth if you topped a plants at the present time, cutting tho leggy character back more severely th remaining, even down to the lowest branches, and also pruning the latter their present length. Beech hedges be clipped annually in spring just growth commences. They will then their leaves throughout the winter A light mulch applied during summ assist free development and bushy con

Unsatisfactory Retinispora

(W. J. O.).—As your specimen incr size and is, apparently, in good he may be surmised that the partial d some portions is due to a local co For instance, the roots may be wor soil which is rather damp, and, if it ble to do so, this may be tested by lif plant. Lifting will do it no harm, at all too large for the operation. planting, use a barrowload of light which has been mixed some brickb plant very firmly. If the specimen posed to cutting winds the partial branches may be traced to that, an March and April an improvised shelt effect a cure. Generally speaking, sporas are always liable in some d the failing to which you refer, and though annoying, is not necessarily

Boundary hedge beneath trees

(D. K.).—Holly, Yew, Box, Laurel, and the common Laurel a very good hedges, but the former doubtedly, the best for this purpose, mon Ilex Aquifolium for preference. ping once each year, between July tember, is all it requires.

Acacia dealbata in the open

(S. W., Torquay).—As not only th Wattle (Acacia dealbata), but A. lo can be most successfully grown in th bourhood of Dawlish, in your coun appears to be no reason why they sh succeed at Torquay. Both flower ea

alike on a wall and in the form of small
n the open. It may be helpful to name

f the temperature, and numbers of bees
ave the hive on early foraging expedi-
never return. It is, therefore, good
to provide plantations of early bee
in the neighbourhood of the apiary.

Snowdrop seed

R. C.).—You must keep a close watch
seed-pods, and as soon as they show
st sign of bursting gather them and
thinly on newspaper in a dry but not
place until dry. It is well to sow
these seeds as soon as they are ripe. A good plan is to sow in pans or boxes filled with light, sandy soil. Cover each with a pane of glass and set in a cold frame which never gets the sun. When the seedlings (they are very fragile) are in a fit state to handle they can be pricked off into other boxes, or else, which is a better plan, sow very thinly, and there will be no need to prick off. They will, naturally, die down and disappear, so the receptacles should be kept carefully out of doors in a shady place until winter, when they can be placed again in the frame, and by the following year may be planted out. They take a little time to reach the flowering state.

Potentilla Farreri

I have a specimen of this which is getting leggy and bare in its lower parts. May I prune it heavily in about six weeks' time, so as to induce it to make some bottom growth? It might be advisable to cut it back hard as one may do with Spiræa Anthony Waterer.

A. H. Wolley-Dod.

[You may safely cut this shrub back to within 1 foot of the ground at the end of March, and if you pinch the tips out of the young shoots which follow when they have attained from 5 inches to 8 inches in length you will hasten the bushy development of your specimen.]

Crinum bulbs

(H. D. R.).—There are numerous varieties of the Crinum, some of them hardy, in your county, if the bulbs are planted about 8 inches deep, while others require greenhouse protection. It is difficult, therefore, for us to give directions suitable for all the sorts. One little detail, however, is applicable to all, and that is the necessity of giving the bulbs a rest. After flowering, every encouragement should be given for the plants to make strong, healthy growth, abundance of water being one of the main aids to this. As soon, however, as full growth has been completed and the foliage begins to change colour, gradually reduce the water supply, but at no time should the soil be left for long in an entirely dry state. In due course growth will again spring, and the amount of water should be gradually increased. The bulbs that fail to bloom should be given same treatment, and will eventually bloom.

St. Brigid Anemones

(Inquirer).—St. Brigid Anemones require a deep, well-cultivated soil rather on the light side. If heavy, steps should be taken to lighten it, and good drainage should be assured. A layer of good, well-rotted cow dung placed a foot below the surface is beneficial, and when the soil preparation is finished the bed should be raised 4 inches to 6 inches above the ground-level. All soil preparation should be carried out well in advance of planting the tubers to allow the soil to settle again. The tubers should generally be planted in September, except in wet, cold districts, where February-planting gives better result. The tubers should be 2 inches deep and 9 inches apart. Early in summer the bed should be mulched with a layer of fine leaf-mould, which helps to keep the plants moist during summer. Water freely during really dry weather. Early in August, or when the plants show signs of ripening by yellow colouration in the foliage, they should be lifted with some earth attached and stored in a dry place until it is time to replant. We will reply to your Celery and Leek question next week.

GREENHOUSE

Primula obconica

(F. A. W.).—From your letter it would appear that the spores of the fungus concerned are not harboured in the tank, woodwork, or glass of your conservatory. On the other hand, you do not keep your plants more than one season, and therefore your new batches must be infected by the spores of Botrytis from some source, either in or near the house. Are there any permanent plants in the house which would be likely to cause the trouble? On the cultural side we should prefer to follow the pricking out of the seedlings by potting them into 3-inch pots and then shifting them on into 5-inch pots. You might try the effect of adding a little sulphate of potash to your potting mixture, and, in addition, a little old lime-rubble. If your turf is not too heavy in character two parts turf and one part leaf-soil would be a better mixture. When the final pots are full of roots a little weak soot-water might be applied once a week with advantage. Primulas like a nice, airy structure, and any damp places in the house should be avoided, because damp conditions favour the spread of the Botrytis fungus. A little flowers of sulphur would help to control the trouble if applied early in the winter when the trouble first appears.

Mystery Lily

(L. D.).—We presume you refer to "The Monarch of the East" (Arum cornutum). After the bloom fades pot up, using good soil and giving plenty of water. Small side bulbs are sometimes produced when so treated, but these would take a considerable time to reach the flowering stage. You can procure large bulbs from Messrs. Barr and Sons, 11, 12, and 13, King Street, Covent Garden, London, W.C. 2.

Pelargonium Mrs. Pollock

(G. F. T.).—This old and popular variety was raised by Mr. Peter Grieve, a most successful cultivator of Pelargoniums. He started in 1853 by crossing Flower of the Day with the pollen of Tom Thumb, and he raised a fine variety, long since discarded, called Culford Beauty. According to Shirley Hibbard it was in 1857-8 that Peter Grieve made the cross Emperor of the French and Gold Pheasant, and the result was the two most celebrated of all the golden tricolours, viz., Mrs. Pollock and Sunset. Further information on the subject will be found in the little "History of Variegated Zonal Pelargoniums," by Peter Grieve, published by Blackwood.

Cineraria trouble

(W. N., Southampton).—We have carefully examined your specimen plant and we can find nothing present that would account for the trouble. The roots are healthy and the plant is free from disease at the collar. It appears to us likely that some cultural detail is at fault. Many things could cause the scorched foliage, *e.g.*, an overdose of a fumigant might do the damage. Water collecting on the foliage during a very cold night followed by bright sunshine the next morning before the foliage had dried might cause the damage. Allowing the temperature of the house to fall very low during any one night, or if the plants had been allowed to become dry at the roots, each might be followed by the burnt foliage. We are sorry we cannot be more definite; we are certain that the plants are free from insect pest or fungus disease.

Richardia Elliotiana

(W. A.).—Failures with this plant are not uncommon, the principal reason being that it is usually considered to be a yellow counterpart of the common Lily of the Nile, and treated accordingly. To grow the variety satisfactorily the tubers must be dried off and well rested. About the end of the year they begin to show signs of starting into growth, and directly this movement is seen they must be shaken clear of the old soil and repotted. R. Elliotiana is a liberal feeder, and a mixture of two parts good loam and one part each of leaf-mould and well-rotted manure with a little sand will suit it. During the growing period the plants must have a temperature higher than that of the ordinary greenhouse; indeed, failing an intermediate house, they ought to be started in the coolest part of the stove and removed to the greenhouse when the spathes are some way advanced. Particular care must be taken that aphides do not attack the foliage. Toward the end of summer the plant goes to rest, and during the resting period it must be kept absolutely dry.

Pelargonium on greenhouse wall

(J. M.).—Early in April thin out all the sappy growths to which you refer and cut the whole of the shoots back very drastically—almost, in fact, to within 3 feet from the surface of the border. Do not water the plant, after cutting it back, for 10 days, then water as its requirements indicate, avoiding, always, a superfluity of moisture. Secure the young growths to the trellis as they advance, occasionally pinching out the extreme tips of the leading shoots, until the space is furnished. This treatment ought to result in abundance of bloom during summer and autumn, but, with the limited heat at your disposal, it is not to be expected that flowers will be produced during the winter and early spring months. In a border such as that described stimulants ought to be given very sparingly, otherwise bloom will be sacrificed to growth.

Greenhouse flowers discoloured

(" Old Subscriber ").—It is fumes of some kind that has caused the trouble, so doubtless it is the heating apparatus that is responsible. If by boiler and pipes, seeing the house is new, the paint on the latter, when heated, would throw off sufficient fumes to do the damage, as would an oil stove if such is used. In the former case the effects will soon disappear, as in a short time no more fumes will be given off, but in the case of a stove inside the house some means must be adopted whereby any fumes given off may escape to the outer air.

CHRYSANTHEMUMS

Chrysanthemum cuttings

(G. M., Stourbridge).—It is not uncommon for early shoots of Chrysanthemums to develop flower-buds. As a rule, the embryo flowers are easily distinguishable, and shoots which show these ought not to be used for cuttings. To obtain the correct type of cutting, the old plant should be top-dressed with an inch or two of light soil, and the temperature of the house should be, at least, comfortable. Do not be, in future, in too great a hurry to secure cuttings. These, produced even at this time, are often better than others taken in November and December in the case of many varieties.

ALPINES

Alpines to cover stones

(" Alpine ").—(1) You greatly restrict the selection by stipulating that the plants be from 12 inches to 15 inches high, the bulk of the best Alpines being much dwarfer. However, the following should suit:—Alyssum saxatile, Cheiranthus, Cistus, Dianthus, Genista, Helianthemum, Hypericum, Iberis, Lavender, Linum, Nepeta Mussini, Verbena venosa. (2) Acæna, Arabis, Arenaria montana, Aubrietia, Cerastium, Cytisus Ardoinei, Dryas octopetale, Erinus, Erodium, Linaria, Lithospermum (see illustration, page 120), Phloxes (Alpine), Saxifraga, Silene, Thymus, Veronica. (3) Double Arabis, Helianthemums and Cytisus Kewensis. Some of the less rampant rambler Roses would also flourish well in a situation like this. (4) For planting between stones:—Acæna, Achillea, Arenaria, Asperula, Campanulas, Cerastium, Erinus alpinus, Sedum, Silene, Thymus, and Veronica.

FRUIT

Birds attacking fruit buds

We have a small orchard joining a copse where there are many birds, and they get the buds of the fruit trees in early spring. We have used black cotton on the trees, which has kept them off for a time, but was no good last year. What remedy is suggested? M. M.

[Black cotton is often successful in keeping off attacks of birds from the buds of fruit trees, but it is only successful as long as the birds cannot find their way in and out of it. When the black cotton method fails, two other methods are sometimes used. (1) A good, thick limewash is applied to the trees so that all the buds are thickly coated with the wash. This is applied during the " delayed dormant period," *i.e.*, when the buds are fairly prominent, but are not actually breaking. If the birds commence operations before this period the wash must be applied so soon as the attack is noticed. Details for the making of limewash were given on page 96 of our issue for February 9th. (2) A solution containing a fairly strong extract of quassia chips is sprayed on to the trees with the idea of making the buds distasteful to the birds. A recipe for making this is as follows:—Quassia chips, 1 lb.; soft-soap, 1 lb.; water, 10 gallons. Boil the quassia with half the soap and half the water for one hour, strain off the liquid, and boil the residue for another hour with the remaining soap and water. Mix the whole together and make up to 10 gallons with water. The recipe is meant only for the purpose stated.]

Pruning Pears and Plums

(Inquirer).—From the description given of the trees you wish to prune, it appears to us that the trees are vigorous and have good main branches set out, and we are of the opinion that you need not shorten the growth so much as you suggest. Cut away not more than one-third of the growth and to a bud pointing in the direction you wish the shoot to continue its growth. The spur growth should develop in time, but by pruning hard, as you suggest, you will be likely to delay spur growth.

American Blight on Apple trees

(W. W. B.).—The following treatment can, from personal experience, be thoroughly recommended for cleaning Apple trees infected with American Blight. Go over the infested parts and with a soft paint-brush daub them with paraffin. In a day or two wash the parts over with strong soapy water, afterwards making a paste of a little soap, clay, and paraffin, filling up any cracks or wounds in the bark. Should the insects appear again after this treatment—and summer is the chief season for them—follow up with another dose of the same treatment. Few will survive the second application.

VEGETABLES

Capsicums and Chillies

(J. M.).—Much depends on the subsequent treatment given the plants, but about the middle of March should prove a suitable time. The fruits remain in condition over a fairly long period. The Egg Plant may, of course, be planted in a frame, but if only a small number are required pots are less trouble.

BEES

The merits of different Bees

Could your apiarist give us an art
the ways and merits of the different
bees—native, Italian, Carniolan, etc.?
interested because I think of getting
Carniolan. Are they specially liable
or to be robbed? W. R. JOHN

The question of the best type of
keep in this country is exercising the
of most beekeepers at the present
Owing to the ravages of the Acarine
the old British variety, which has
this country for thousands of years, h
practically wiped out; few, if any, real
stocks remain.

For some years past bees from eve
of Europe, as well as from the U.S.A
been imported, and to-day most
apiaries contain a very mixed lot,
hybrids from Dutch, Italian, Frenc
Carniolan strains.

The difficulty of pure mating has
made it almost impossible to keep a
ticular strain pure for any length
but we have now many expert queen
in different parts of the country
isolating apiaries and careful manage
the production of drones, are fairly
ful in this important work, and I
advise beekeepers to obtain their quee
these sources instead of sending
Quite apart from encouraging Britis

are greatly superior to those importe

Each foreign type of bee has its
characteristics, and many coming
warmer clime than ours are not a pe
success here. Probably the most sat
type of bee at the present time is the
bred Italian, which has been rear
selected stocks for several generation

Some of us still hanker after
British bee, and if it could be obtai
I still think it would hold its own,
surplus honey point of view, w
Italian. It may not be quite s
handled, but fewer manipulations
required. Certainly we had less trou
swarms in the old days.

Unfortunately, most so-called '
bees nowadays have been more
crossed with Dutch, and the Dut
such excessive swarmers, are practi
less as honey-producers, and any
Dutch blood in it should be avoided
great pity that they were ever introd
this country.

Carniolans, though good comb bui
very quiet to handle, have also thi
ing propensity, but not to the exte
Dutch. Many beekeepers have b
successful with these bees, but they
kept pure, so it generally means
importation of queens.

French and Cyprian bees are a
ing experiment to those who do
plenty of stings. I have found th
unmanageable. I tried them fo
three seasons, but was very glad
last of them.

Most imported Italians came fro
trict around Bologna, in North Ita
of these do exceedingly well in thi
but they vary considerably, and do
up to the selected types reared here

For those of us who have the
patience queen-rearing is a most
hobby. It is well to remember th
drones are as important as select
Never rear either from stocks
swarmed. We thereby perpetuat
thing we want to avoid.

Excessive swarming is the bane
bee-keeping. L. BIGG-

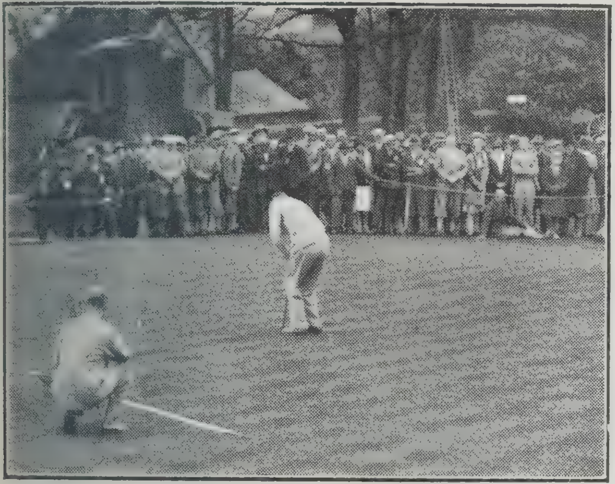
By Appointment

FISONS' FERTILIZERS

ENSURE BEAUTIFUL LAWNS



COMPSTON v. HAGEN. MOOR PARK GOLF CLUB, 1928.
The greens of the Course were prepared for this International Event by the use of Fisons' Lawn Guano.

AT this period of the year a small outlay on a scientific fertilizer will quickly create dense turf and help to provide an even growth of fine grasses throughout the season.

If weeds are troublesome, these can be eradicated by means of Fisons' Lawn Sand.

Fisons' Technical Bureau
The advice of our Technical Bureau is at the disposal of the Public, who are invited to write, without obligation, for advice regarding treatment of Lawns or concerning any other difficulty experienced in the Garden. Attention is drawn to the fact that we specialise in Lawn maintenance, and arrangements can be made for our representative to inspect playing grounds to advise upon suitable treatment.

FISONS' LAWN GUANO

(A Compound Fertilizer)

the safest dressing for turf. It feeds the turf over a long period, and will not burn or discolour the grass. Lawn Guano quickly strengthens the roots and encourages a dense growth of fine grass. As used by important clubs and municipalities. Apply now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.

PRICES (in bags): Carriage paid	7 lbs.	14 lbs	28 lbs.	56 lbs.	1 cwt.
	3/-	**5/-**	**9/-**	**15/-**	**25/-**

FISONS' LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.

PRICES (in kegs): Carriage paid	14 lbs.	28 lbs.	56 lbs.	1 cwt.
	5/-	**9/-**	**16/-**	**27/6**

FISONS' BASE FERTILIZER

should be incorporated with the soil before sowing grass seed. Specially prepared to promote strong root growth and give new grass a good start. Use 4 ozs. to the sq. yd. a few days before sowing the seed.

PRICES (in bags): Carriage paid	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
	3/-	**4/6**	**7/6**	**12/6**	**20/-**

FISONS' GRASS SEEDS

are the finest procurable, being specially tested before selection.

Special Mixture (for Bowling and Golf Greens). Finest grasses only.

PRICES (in bags): Carriage paid	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
	15/6	**30/-**	**58/-**	**110/-**	**210/-**

WRITE FOR FISONS' BOOKLET "LAWNS"

JOSEPH FISON & CO., LTD., IPSWICH

Specialists in Garden Fertilizers and Lawn Renovation

LAWNS

MISCELLANEOUS

Poultry manure

(A. E. C.).—To spread fresh poultry manure on the surface of dug ground is very wasteful, as much of the value of this material evaporates, and is thus lost. It would be better to scatter it thinly on undug ground, and if it were impossible to have it dug in at once to at least lightly fork it in. Of course, you could do this on the dug ground, providing it is in a fairly dry state, but to work soil in this way while sodden is very harmful. Much the same applies to scattering this manure between growing crops. If it can be lightly forked in it will, in many cases, be beneficial, while if left lying on the surface much of its virtues will be lost. Most root crops are best without this material.

Lawn sand

(A. B.).—Lawn sand, whether "home-made" or bought in "ready-made," is used for the destruction of weeds on lawns. The theory underlying the practice of applying lawn sand is that a quick-acting nitrogenous manure is applied which burns flat weed foliage and does not burn the upright foliage of the grasses to any extent, because the grass foliage fails to hold the manure. This has the effect of reducing the vigour of such weeds as Daisy, Plantain, and Dandelion, while at the same time it encourages the grasses to grow vigorously. The weeds are smothered out by the combined effect of burnt foliage and the increased vigour of the grass.

LEGAL POINT

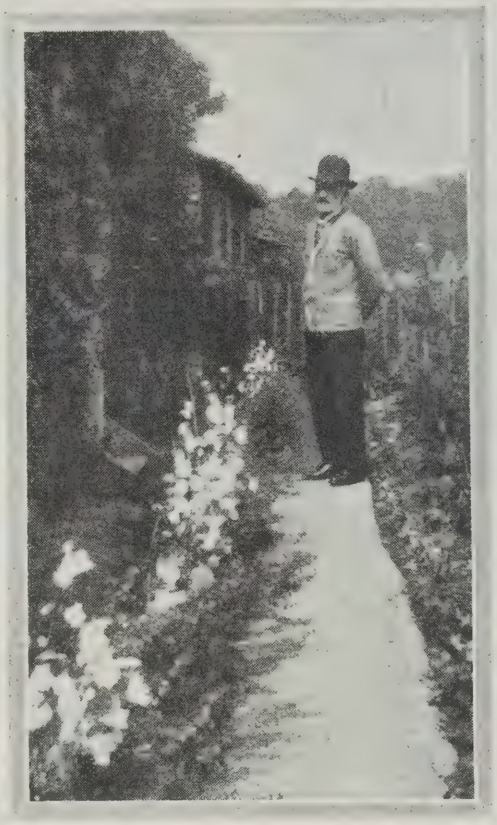
Gardener's notice

(L. J. S.).—Yes, in the absence of any special agreement between your employer and yourself providing for a fortnight's notice you would be entitled, by custom, to a month's notice. Obviously, yours is not a weekly engagement, or your employer would have given you a week's notice.

John Benn Hostel Ballot

The results of the Boys' Ballot in aid of the John Benn Hostel have now been published. The winner of the first prize, the Standard touring saloon motor-car, was Mrs. F. Bromfield, of Huntly, who gave a forecast of the voting in the exact order decided by majority of votes. Among the many prize-winners a number will receive those given by the generosity of firms in the horticultural trade. We give below a list of the prize-winners of this section:—

H. W. Tarratt, 5, Decoy Avenue, Golders Green, N.W. 11; "Pennsylvania" lawn mower, Lloyds and Co. (Letchworth), Ltd. Desmond Owen, "Normandale," Upper Bangor, Carnarvonshire; "Amanco" lawn mower, Associated Manufacturers' Co., Ltd. R. E. B. Willis, "Sherdley," Moss Lane, Timperley, Cheshire; garden furniture, Thonet Bros., Ltd. J. A. Sweetlove, 40, Grove Street, Stockton-on-Tees; Roses to value of £5, Stuart Low, Esq. Mrs. Weir, 81, Leigh Hall Road, Leigh-on-Sea, Essex; garden seat, Castle's Shipbreaking Co., Ltd. Mrs. L. Baker, 163, Finborough Road, West Brompton, S.W. 10; "Ironcrete" garden roller, Scoffin and Willmott, Ltd. Mrs. Garratt, 356, Romford Road, Forest Gate, E. 7; "Vinculum" garden ornaments, Tarmac, Ltd. J. R. Burn, 12, Tennyson Street, Grimsby, Lincs.; "Eclipse" garden sprayer, Eclipse Spraying Co., Ltd. Charles Bell, Heston, Ben Rhydding, Yorks; case of "Arden Bloom" fruits, Angus Watson and Co., Ltd. Mrs. F. Brookes, Warwick Road, Solihull; "Martsmith" insecticide spray gun, Martineau and Smith. Mrs. E. Coupland, 41, Green Moor Link, Winchmore Hill, N. 21; two dozen Rose trees, Barnham Nurseries, Ltd. W. R. Kettle, Kent and Essex Yard, Aldgate, E. 1; "Killamist" hand sprayer, etc., Cooper McDougall and Robertson, Ltd. A. C. Hoare, 63, Englewood Road, S.W. 12; garden hose, Reliance Rubber Co., Ltd. Miss H. Rodwell, Sun Hotel, Kingston-on-Thames; 1 cwt. "Fisons'" lawn guano, J. Fison and Co., Ltd. R. G. Elms, 58, Queen's Road, Wimbledon, S.W.; "Vermorel" spraying pump, Cooper Pegler and Co. L. C. Jones, "Rosedene," Baysham Street, Hereford; 1 cwt. "Vickers" fertiliser, T. Vickers and Sons, Ltd. R. H. Bartoy, 11, Buckingham Street, Bletchley, Wolverton, Bucks; "Abol" syringe, Abol, Ltd. Mrs. Margaret Fitzpatrick, Cellon Works, Richmond; 1 gallon "Vitrolite," W. Carson and Sons. R. Bleazard, Brumgerley, Bowys Lane, Palmers Green, N. 13; two basket chairs, Orsett Basket Works. J. Finch, Egmont, St. John's Road, Tylers Green, Bucks; Rose trees to value of £1, Spooner and Sons. The following each received a collection of flower seeds from Toogood and Sons, Ltd.:—Mrs. J. S. Gilbert, Solihull; Miss Lavinia Morgan, Balham; Mr. Lawlor, West Hampstead; Mr. W. J. I. Tucker, Limpsfield; Miss Littlejohn, Thornton Heath; Miss M. V. Ramsden, Nottingham; Miss N. Fox, South Chingford; Mrs. Lucie Dufour, Crouch End; Miss Ethel Shepherd, Ribchester; Miss Joy Jarrold, Banstead; Miss Eva C. Asbridge, Plaistow; Mr. Rayner, Palmers Green.



The late Mr. James Mayne in his garden at Eltham

The London and South of England Viola and Pansy Society

At the annual general meeting of the above Society, held recently, the report showed a satisfactory year's working.

Mr. Eric Holroyd was re-elected President and Mr. John H. Little, "Brent Tor," Brentwood Road, Romford, Hon. Secretary and Treasurer.

The third annual show will be held
Royal Horticultural Society's new
Westminster, on July 16th, 1929,
classes will be again provided for Vio
hibition and bedding varieties), Vi
species, and Pansies.

The Society will offer, for the firs
certificates for new varieties of Viol
Pansies.

The Secretary will be pleased to
any interested persons with particular
Society. The subscription is 2s.
annum (minimum).

Ryders

NOTICE!

THE BITTER FROST we ave had is a blessing in disguise. It will do more good to our gardens than anyone dreams of: **purifying, cleansing,** and **nriching** the soil. The universal experience is that a itter Winter is always followed y a wonderful Spring and ummer.

Orders should not be delayed ut should be given immediately o that work can begin directly he frost goes.

Our large edition of catalogues is being exhausted, but we can promise a copy by return f it is asked for at once—*write o-day.*

Kindly mention this paper.

DER & SON (1920), Ltd., Seed Merchants

St. Albans

Are your Drives and Paths giving trouble?

DO you continually have to fill up the ruts caused by heavy rain? If so, we can mend them permanently with "COLD CHON." All you require to do is to pour "COLD CHON" on the paths, about one gallon to three square yards, cover it over with gravel, ash, or chips, and there you have your path as you would like it to look and remain; and it *will* remain because the "COLD CHON" is holding the surface tightly in its place.

NO FLOODS will have the slightest effect on your paths now. "COLD CHON" is cheap and the money saved on annual upkeep is considerable. As a skin is formed under the gravel it is impossible for weeds to appear.

Ardenconnel Avenue, Rhu, Dumbartonshire.

If you have a large area to treat, we will, at a small extra cost, send one of our men to lay the "COLD CHON."

Write to us for a booklet:

Modernise with Colas!

This fine drive was treated with COLAS in August 1928, and the surface is still in excellent condition. A dressing of COLAS applied by anyone at any time of the year, without skill or special apparatus, will provide the ordinary gravel drive with a lasting surface *without spoiling its appearance.*

One drum, containing 30 gallons, costing 40/-, delivered direct to destination within the Railway Company's free delivery area, will cover approximately 100 sq. yds. of gravel drive or path. A considerable reduction is offered if two or more drums are offered.

Write to Estates (K) Dept. for 24-page Booklet and Prices.

Three R.H.S. Gold Medals in 1928 An absolute record

Blackmore & Langdon's
WORLD RENOWNED
Begonias

Gained the R.H.S. 60 Guinea Coronation Challenge Cup in 1927
Awarded over 110 Gold Medals

IN SUPERB QUALITY FOR GREENHOUSE

Collections of Super-Quality *named* Double Begonias. £7/10/-, £5/10/-, £4, and £3 per dozen. *UNEQUALLED QUALITY AND VALUE*

FOR BEDDING

Doubles, in 8 colours, flowers like large Roses and Camellias	**6/-** per doz.	**42/-** per 100
,, mixed..	**5/-** ,,	**35/-** ,,
Singles, in 6 colours, very large, fine shaped flowers	**4/6** ,,	**30/-** ,,
,, in mixed colours	**3/6** ,,	**24/-** ,,
,, Frilled or Crested, in 6 colours	**5/-** ,,	**35/-** ,,
,, ,, ,, in mixed colours	**4/-** ,,	**28/-** ,,

Collection, 36 Tubers, 12 Doubles, 12 Singles, 12 Frilled Singles **14/-**

Collections of **12** named hanging basket Begonias, 3 each, 4 sorts, **47/6** and **32/6. Excellent Value.**
Unnamed hanging basket Begonias, **7/6, 10/-, 15/-** and **21/-** per doz.
Post Free on Orders of 10/- and over.

DELPHINIUMS

Awarded 5 R.H.S. Gold Medals from 1924 to 1928. An unparalleled achievement.
Large Gold Medal at Shrewsbury Show in 1928.
17 Awards of Merit at R.H.S. Delphinium Trials at Wisley in 1925.

PLANT NOW. We have pleasure in offering the following Collections, which are specially good value, in strong ground roots, which will make a fine show of bloom this year.

Collection A, 12 extra good sorts .. **70/-**
,, **B,** 12 very choice sorts .. **42/-**
Collection C, 12 fine sorts **30/-**
,, **D,** 12 good sorts **20/-**

PHLOX DECUSSATA .. .. } A selection of the best and latest sorts, **9/-** per doz., respectively.
MICHAELMAS DAISIES .. .. }

PERPETUAL CARNATIONS, in 2½ in. pots, fine selection, **12/6** per doz.

Sermons in Stones

O GOOD IN EVERYTHING! That am prompted to add my quota to the on on rock gardens, especially as the of the R.H.S. is desirous that rock exhibits at the Chelsea Show next ould be of as varied a selection of other than limestone, as possible. ve none of the protagonists put in a r Cornish granite? Is it that the ransport is against it? But the same e urged against West- or Yorkshire, or stone. It all depends vicinity of the proposed n. Yet the Cornish omes nearest in appear- the Westmorland stone, remember—was it four o? (I think it was that s year when the open- was a deluge, and only rdy souls paddled about hes outside)—when an in Westmorland stone sensation of Chelsea, so was everyone with the l rock picture. Could exhibitor go one better nish granite from the le of England? Per- . Clarence Elliott has nade a note of it, to be in that list of rocks and of supply of which he in GARDENING ILLUS- of February 2nd. To he best results in any gardening one should ke into account the lie nd and the character- the surroundings, so fall into place without effort. In the North ere is the rugged stone ake District, mellowed countless "becks" em, a merry trickle in ner, a roaring spate in There is the cold al grey stone of the Yorkshire d dales, the warm red of the sandstone, the slatey-grey boulders Wales, the yellowish Bargate of ound Guildford and Godalming, the e Cheddar Gorge that inspired the Cheddar sheltering from a thunder- write the immortal hymn, "Rock s' choice enough and to spare, but surpass the rock of Cornwall, its granite. And as an object-lesson of erfect rock garden ought to look, table Duchy offers itself that he r may read. Bodmin Moor, with its far-flung outcrops of ancient granite forming the gateway on the north to the coast road from St. Ives, through Zennor, leading literally to the Land's End on the south of the county, provide countless pictures that leap to the mind of an ideal rock garden if Fate were to domicile one on the spot.

And as if to prove how inviolate is the native stone as a protector to the precious plants in its charge, on the Friday of last week, when the *stürm und drang* of the terrible east wind had given place to warm sun and blue sky, and the Cornish Riviera was itself again, even though the rest of the world still froze, there in the dell, amongst the granite boulders, stained by the weather to every conceivable shade of ochre, burnt sienna, Lichen-green, and purple, were patches of bloom to greet me on every side.

"Sermons in stones"

Daphne odora is scenting the air with its pink and white flowers, Grevillea rosmarinifolia is crimsoning at its tips already, Hamamelis arborea is suffused with a gold and brown glow, Cyclamen ibericum and C. repandum form a rosy carpet slightly raised above the floor of the dell, and the dear little Narcissus (Hoop Petticoat) are lifting their golden heads to the sun. There is joy amongst the silvery encrusted Saxifrages, for snow is their native element. Not so S. oppositifolia and S. cæspitosa, the damp has not been to their liking. S. Irvingii is opening its short pink blossoms, also S. Myra and S. Obristii, Primula Juliæ is full of bloom, with its relative, P. Jewell, not far behind. P. Mrs. Wilson is not as early as usual this year, but several of the coloured Primroses, like Mme. Pompadour, are out, and innumerable seedlings, I expect of Japonica, are appearing all over the dell, even on the floor. I shall watch these with care, as there may be some good crosses among them.

Though it is quite irrelevant to my theme, I cannot "quit talking" without a passing reference to a standard colour chart. I should not like Major Chappell to think I was against such a thing. Far from it. It is a sound proposition, but I do not see how my suggestion that colour descriptions would be better done by women than men militates against it in any way. I can assure him that women keep their colour values very neatly pigeon-holed and labelled in their minds; those that belong to dress and fashion are kept to that department, those that apply to decoration and flowers are definite and concise.

What I was trying to prove was that as gardening in its proper sense was becoming more and more a woman's pastime, as well as her "job," it is high time she had a say in the matter. The ideal home should have its setting in the ideal garden, and in both home and garden colour plays a very important part. But we like those colours to be what they are *said* to be—if cerise, then we expect a rich, glowing rose, almost akin to scarlet, not a wishy-washy dull claret; if blue, then we expect blue, not purple or mauve; if orange, then we expect a colour like unto the rind of that useful fruit that is now being made into marmalade by thousands of British housewives throughout the land. Oh, yes! I am quite sure Coventry Patmore meant his angel in the house to be the angel of the garden too.

E. D.

Eucomis punctata

EUCOMIS PUNCTATA is one of the flowers which are on the border-line between hardy and tender plants, so that it cannot be recommended for the herbaceous border in any but mild localities, although where it stands the winter it is a plant of much beauty. That it is hardy in a good many places may be gathered from its being frequently shown at the autumn exhibition of the Royal Caledonian Horticultural Society as a hardy border plant, and the writer knows of gardens near the sea coast where it thrives well and has stood severe winters without injury. It is a very distinct-looking plant. It has rather broad, long, green foliage, spotted, and spikes of wax-like white flowers spotted with rose. It grows about 2 feet high and likes a light soil and a sunny place. If so treated it will flower in early autumn. Some who do not succeed with E. punctata as a permanent occupant of the border pot it up in early autumn when it flowers and place it in the conservatory, where it is quite an ornament and flowers longer. Others plant it out in late April or early May, and before frost comes with any severity lift the tuberous roots and keep them in dry sand beyond the reach of frost until spring, when they are replanted.

S. ARNOTT.

Bearded Irises: "Eastern Pallida" forms and their descendants

The letter by Mr. R. W. Wallace (issue February 9th, page 82) is interesting to me, first because about the year 1920 my stock of Iris Cypriana came from him, and I have often wondered how he came by his stock. Was it from Siehe, the German collector at Mersina? Secondly, in 1921 I received some rhizomes from Tarsus. Mersina is the port for Tarsus, and from a note I have in my book it was first thought to be an improved Cypriana.

In my old garden in Bexley they grew alongside one another, and up to 1925 the two varieties bloomed about the same time, and we generally regarded them as one and the same variety.

When I came to Sevenoaks they were again planted alongside one another. Last year's wet weather, however, played all sorts of tricks with my Irises. Some varieties bloomed excessively, whilst others did not bloom at all, and so it was with Cypriana and Tarsus. The former did well, but with the latter not a bloom; so much so that I have now consigned such rhizomes as I could house to what Mr. Pilkington calls the Ricardi shelter, where, in company with Mesopotamica (which Denis gave me), the true Kashmir White, the Californian, and other obstinate varieties and species, I hope they may behave themselves.

I have said that the so-called Cypriana and my Tarsus we regarded as one and the same thing, and yet from the fact that one bloomed and the other did not they cannot be the same. It will now be for me, when they come to maturity, to try and find out where they differ.

When in Crete I brought away roots of a Cypriana variety which was growing in an orchard. The stems measured 5 feet 5 inches. They were firm and needed no supports. The blossoms were identical in colour to Cypriana and Tarsus.

This Cretan variety has not bloomed with me; in fact, I may say that of all species, whether Cypriana or Germanica, I have collected myself in Majorca, Macedonia, or Crete, I have never yet seen a bloom.

I am now hoping that in the shelter of the glasshouse as devised by Pilkington we may get some good results. Since we planted these odd varieties into the shelter in August and September no water has been given. The glass sides are wide open all the time. In March and April all lights will be removed and the plants allowed to get all the rainwater available.

I have two other species which have done well—one from Kirman, Persia, which is a Kharput, and a white form from Mount Athos. This last is the only Iris in this place at this moment, with its full complement of foliage of a yellowish-green; leaves are narrow and pale, and, according to Dykes in "Genus Iris," p. 165, would be germanica Var. florentina. In the trials at Wisley it got rather high marks, not far off Istria, which came out about first of the whites.

—— The articles relating to the so-called "Ricardi seedlings" are very interesting, particularly that one written by Sir Arthur Hort, issue January 26th. I remember that he wrote once before about the Ricardi seedling that was given to him by Sir Michael Foster, and it inspired me to make a list of Irises that are supposed to be "first crosses," using Ricardi as one parent. Perhaps this list might be of some use to your readers, though, when the new check list
American Iris Society comes out al
parentages will be given in full. All
Irises in this first list are first cross
Ricardi, which we consider (as d
Dykes) a form of mesopotamica. H
it seems to be a form that gives wea
scendants than the true mesopotam
what we know here as I. cypriana.

Dwarf Campanulas

oes not always follow that the one who es himself on growing the taller flowers in his garden thinks much the diminutive sorts that serve such a purpose as plants for edgings, ies, and the like, yet the dwarf sorts y attractive and remain in flower for time. If this note should catch the someone who is thinking of making ns to his borders and needs a per- "edger" I would suggest a trial of of the dwarf Campanulas. Any tely good soil suits them, for prefer- at of a sandy nature, and they grow , so that in about a year one may them and make extensions. Here are worthy of attention:—G. F. Wilson, large, violet-blue; Muralis (portensch-), small blue flowers produced in ; Pulla, dark purple; Turbinata, rich ue; Pumila (pusilla), very dwarf, full s of pale blue flowers; Carpatica in ue and white forms; Garganica in blue ite, of a dwarf, creeping habit, good eries and window-boxes; Haylogensis uble blue flowers; loves a dry, sunny . Once established, the dwarf Cam- s are no trouble, except for dividing vals.

Rock Gardens at Chelsea

very glad Mr. Elliott (in your issue ry 4th) so tersely and sensibly expres- opinion that it would be a good thing Show and exhibitors and the public Council of the R.H.S. would consent ish the distribution of prizes for rock- s.

putting his three or four reasons, r, he goes on to say that "if cups dals must continue, a system of point- ould be instituted and made known both judges and exhibitors, so that rs may know what to expect from the and the judges may know how to deal xhibitors."

of all there is no reason why cups and *must* continue. I am going to risk a reputation for inconsistency by that any system of pointing is a com-

the first this system has been re- o in connection with the rock gardens most progressive and beautiful of our ial shows—Southport. Below I give tem of pointing suggested by myself dly accepted by the Committee and in the schedule:—

mum points will be awarded as under

	Points.
le design, proportion, and shape …	8
plicity, direction, continuity of the ain lines produced by the ridges of one (the placing of rocks and plants to nvey an illusion of distance is included this, also the design connected with y display of water)	20
setting of the stones (picturesque lay- g consistent with Nature and general iet effect)	14
B.—Great attention should be given to he placing of isolated stones, as this ffects both "design" and setting.	
proportion of each colour used in anting the rock gardens	10
colours chosen in planting and their lative placing in harmony with one other	18
ll in regard to grass laying, careful anting, hiding cement, background, c.	6
lity, suitability, and rarity of plants..	24
Total maximum of points.. ..	100

uld almost seem that, using a system the above, a judge could hardly be of error—on paper everything looks athematical.

And indeed it is quite easy for the judge, and may be done with fair exactness so far as the pointing goes. At Southport there are never the more or less justifiable complaints against slack and incompetent judging, overruling of judging, patching up, etc., one has often heard—I think every time—at Chelsea. As a compromise it is the only practicable one to be thought of. But why compromise at all? The greatest quality of a rock garden is its ability to please its prospective owner.

At the last Southport Show things were very crucial. The rock gardens were really fine, but appeared so near together in quality (up to the requirements of the points) that the judges (Mr. Harrow, of Edinburgh Botanic Gardens, and myself) felt rather nervous to begin with.

But the saddest fact of all to me—*as a "judge"*—was that, of all these almost equally beautiful rock gardens, not one was like another in *style*.

By degrees these exhibitors had arrived at varying styles (not degrees) of excellence. I felt very small—as a "judge" of anything human or artistic ought to feel.

One man had a rock garden with craggy effects, another some beautiful wild features with hummocks of Fescue Grass, innumerable positions for plants, etc., another a very intriguing grass plot surrounded by rockwork, another a very low rock garden splendidly suited to both rock and bog plants in its varying aspects, and so on. One might make a shift to give points for design, etc., but there is always that elusive property one cannot give a name to—never heed points for, because one cannot compare it with its neighbours—or because one person cannot be representative of all tastes. Why not merely cancel "X" then? Because "X" does not occur in the same proportions in every exhibit.

Thus we come back to the blatant fact that one cannot compare the beauty of a beautiful gipsy brunette with that of a beautiful Norwegian blonde—or that of Tosti's "Goodbye" with "Drinking"—or that of a splendid bridecake with a splendid beefsteak.

So, brothers! Whilst Cups and Medals continue we are still confronted with the possibility of a queue at the Secretary's tent of men who should all have been given the first prize or the Gold Medal. There is the "rare plants" man who has last year's Meconopsis doing its best to die by the side of a Funkia, asking whether the judges can have noticed his two new Lewisias; the "plenty of plants" man drawing attention to his opponents' lack of colours and his own badly placed but grand masses of Phlox Vivid, Pink Thrift, etc.; the "well-grown plants" man with his enormous rosettes of Sempervivums backed by Heaths; the Merlin's Cave man, who has gone to tremendous expense and thinks he sees his finish; the "quarry owner," who has laid his stones in such purely "creative" positions, and says his stone is the best for growing plants on—they are all there, or go up one by one for "a word with the Secretary." The artist, too—he who worked so patiently accentuating lights and deepening shadows—he goes, but when he hears the others discussing their intensely plausible and practical objections he waives his own and asks for another luncheon ticket.

Campanula carpatica turbinata
A glorious large blue-flowered variety from Eastern Europe

I repeat, the only really valuable testimonials to the worth of one's work are to be expected from the public as they in turn express their several and very various and very frank delight, indifference, dismay, horror, etc., as their respective tastes give response to whatever they behold.

I remember being very flattered once by a film producer who wanted to know if four of his girls could come and do a bathing scene in my pond at 4 a.m. the next day. He said my "show" was the only one worthy of the ladies. I told the man I should not be in a position to make any objection to the hour, provided the R.H.S. did not mind. It was the first day of the show and everybody was very tired.

If only Show Committees would set to work and help exhibitors over such difficulties as transport, backgrounds, banking up (revetments), and supply of boards for same, decent meals, within reason, for one's labourers all the time, such provision would stand for more than awards.

The system of giving awards will *not* go on. The next generation will abolish it if we do not. We who are now aware of its "fogeyness" should abolish it without delay.

There is no such thing as the "monotony of excellence," and there is no such thing as excellence where we are trying to compare exhibits of unlike properties.

The question of awards influences very greatly the conception of an exhibit. For instance, formal building and rockwork could be so intermingled that such work could not be classed as rockwork nor as a formal garden, but might produce a most beautiful garden, though gaining no "award" because it could not be "classed."

If this exhibit ever happens it will strike a new note, that note will not be sustained, and the R.H.S. Council will be looking for the lost chord, *i.e.*, a name for the above new kind of garden so that they can fit up a new range of awards. These "nameless gardens" will multiply until "awards" become a farce.

"Sandstone's" point regarding the desirability of making one's exhibit at Chelsea more or less of an education in stonework is very appealing, and every rock garden artist worthy of the name has frequently had these thoughts at the back of his mind, I should say, but in all cases the ideas have had to more or less stay there because of the expense one would at present have to go to in the construction of a rock garden of a decent size to be more than incidentally educational. I do not think anyone bar an exhibitor himself has any idea of the cost of a really first-rate rock garden at Chelsea Show.

I think the present rock garden sites at Chelsea Show are quite all right, but there ought to be more of them. If they could only be continued into the other gardens it would relieve the ever-increasing pressure. Those gardens are beautifully "banked" for all shapes and aspects of rock gardens, and the whole thing could be done fairly by lottery drawings for order of choice. Even only four or five sites would relieve pressure tremendously.

I agree with Mr. Dillistone ("Hear, hear") in wishing that the sundries could be put into a better place, even for themselves, but in view of the fact that we are not allowed to show in the Ranelagh Gardens, and that most of the big formal gardens extend from one avenue to another, I do not see how it can be very well managed, unless they are put to the west side of the tents, and I do not think that would be quite fair to them.

I think we of the "no awards" convictions can sense a change coming—a newer and brighter state of things, in which the R.H.S. will appeal to that high creative instinct which impels every man to do his best to make something beautiful, quite irrespective of any extraneous "awards," which latter appeal to his cupidity and put in motion a whole series of very much less worthy thoughts and deeds. How greatly the public would gain! They would see the *individual* best of every man, instead of, in due time as at Chelsea now, a row of men toddling along more or less in the rut made by the one usually getting the first "award."

4, Fitzroy Street, W. 1. J. WOOD.

The Suggested Society of Landscape Architects

Allow me to say how thoroughly I agree with Mr. Mawson's contention, issue February 16th, 1929, that it is useless to form an institute of landscape architects or gardeners without an examination and qualifying degree. One has only to see the "crimes" perpetrated by the so-called landscape gardener, often a jobbing gardener or a nurseryman (better engaged in plant-raising), to realise this. But I would like to make the suggestion that any such degree in design should be combined with one in horticulture, or plant knowledge. In the United States of America, where I have travelled extensively, while lecturing on gardening, garden design is highly appreciated, and I have seen some really exquisite examples. How indeed could it be otherwise when so many facilities are offered to students in the way of travelling scholarships, which gives them the opportunity of studying the fine designs of the old English, Italian and French gardens. But even with these beautifully designed gardens, there was very often an entire absence of intelligent planting, and I saw more than one where the unsuitable plants advised on the plan had died and been replaced by a local man, without much idea of colour or form.

They have more difficulties than we have, possessing many different climates, ranging from dry heat and cold of great intensity to the humid and semi-tropical. But they now have many good schools of gardening, where design is well taught, also an earnest desire to obtain perfection, as shown by their garden libraries in large cities and their numerous garden clubs, whose members work for the benefit of horticulture and the good of rural districts in an incredible manner, and achieve much in the preservation of Nature's beauty spots. Our own best designers, for want of a better word, are not entirely knowledgeable, and have been known to recommend Yew hedges, Ivy, and Holly (which will not live north of Washington) with dire results. Some fine work was done by the late Mr. Mawson, whose admirable gardening work and design for the
Prince's Palace at Athens gave on
pleasure, and I beg to conclude by
my very best wishes to his son, in hi
to set garden design in its right plac

/ariation in Crocus ancyrensis

IE Angora Crocus was one of the first ernal species to show its face in the vintry world of last January. It is piti- nat such a brave little pioneer should suffered so severely from Jack Frost, y days, and hungry sparrows. A few buds which I gathered were so de- d with the warmth of my hand that by me I laid them on my study table they pened, just as you see them in the little tte I could not resist the pleasure of ng. C. ancyrensis is always among the st in the new year, which is one point credit; a second virtue is the lively e glow of its open flowers. Perhaps rather a dwarf and small species, and nay account for its absence in so many ns where early-flowering plants are 1.

hough it is plentiful in Central Asia , near Angora, Kaisarieh, Marash, and it has not been collected in any quan- f late years. Fortunately, it is a very grower and a free seeder. To the last ous quality I owe the forms shown in llustration. Maw wrote that it was ariably self-coloured," and it was not 1901 that I ever noticed it contradicting statement. Then among some corms t from Messrs. Van Tubergen I found lant with seven dull brown stripes on ter surface of its three outer segments. ngs raised from this plant started a of forms, most of which are more feathered or suffused with reddish- than the parent. The darker flowers drawing are from one I selected and ariety suffusus. The whole ground is of a richer, deeper orange tint than type, and the brown suffusion is of a brown-madder shade.

light flower is a puzzle, for it is not f a remarkably soft sulphur-yellow and out, but the segments are rather and more starry in effect than one s in this chubby little species. It is, y, very pretty, however inexplicable e its inheritance of a slim figure and colouring.

Sweet Chestnuts

It has long been a matter of wonder to me that these are not planted for fruit in England, where the Chestnut does so well, even giving us its smaller fruit in profusion (should they be called nuts or fruit?).

There is a variety called dela Valloniere, which is said to fruit three years after grafting. After waiting two years for same to be sent me from France, I was greatly disappointed to find they were grafted quite low down instead of on a half standard, as I anticipated. I shall keep them to one stem and hope for the best.

Marron de Lyon, Numbo, and Paragon are generally planted in France.

ALICE MARTINEAU.

Mendel Tulips

This new race, the result of a cross between Duc van Thol Tulips and the Darwins, has a future before it for early forcing, and when it has been better " selected " we shall not get, as at present, a mixture of tall and short Tulips growing in the same pots. Mine are of a charming carmine-red, the flower being of the same shape as the Darwins, or a trifle smaller. They have not been forced, merely brought on in a frost-excluded greenhouse and sent up to me in London before the buds showed colour. Since then they have been in a warm sitting-room with plenty of electric light and such sun as has appeared. As my Darwins will not bloom for at least a month, and my Couronne d'Or are only just showing colour, I am glad to have the Mendels. If they would all bloom at the same time the variation in height is rather pleasing for pot work, ranging from 7 inches to 13 inches.

ALICE MARTINEAU.

Forms of Crocus ancyrensis

Lilium candidum speciosum (the black-stemmed Madonna Lily)

I was much interested in Mr. Clarence Elliott's reference to this Lily in GARDENING ILLUSTRATED of February 2nd.

The common form is not generally any too happy in this district; one rarely sees, even in the oft-quoted cottage gardens, really big healthy clumps.

On the other hand, the variety speciosum, a by no means common plant, is not unusual. Here, in my own garden, we grow it by the hundred, and it certainly seems much more dependable than the type. It thrives in sun or shade, increases readily by division of the clumps, and I have never known it to suffer from the disease.

I hope my experience may be cheering to some of the many gardeners who have hitherto failed with what is assuredly the loveliest of all Lilies.

EDITH WEBB.

Manor House, Newington,
near Sittingbourne.

Coloured Primroses

I read the article in the issue of February 23rd on the colours of flowers with great interest.

The subject of variation in colour in our native plants, mentioned by your contributor, is very interesting, and such variation has to no small extent benefited our gardens, as witness the named varieties of our native Heathers, which are practically all of natural origin, found growing on their native moors.

In the case of some wild plants colour variation is pronounced, a good example being Cardamine pratensis (the Lady's Smock). The flowers of this species vary from an almost pure white to deep mauve, and apparently soil or habitat has not much to do with the different colours.

On the other hand, some native species vary very little in colour. I should be interested to know if any of your correspondents have come across Primroses notably differing in colour from the common yellow. About two years ago I was walking through a Surrey wood when I saw a group of three plants with pink flowers, growing among hundreds of their yellow-flowered fraternity. One clump had bright pink flowers with no trace of yellow in the petals at all. The other two had paler pink flowers slightly tinged with pale yellow. The plants were growing in the heart of the woods, about 2 miles away from the nearest house or garden. This, I think, is the only time I have come across wild " coloured " Primroses.

Esher, Surrey. G. F. COOMBS.

Among the Hardy Flowers

Linaria macedonica

THOSE who know our native Toadflax, Linaria vulgaris, may form some idea of the Macedonian one, which is a far superior garden plant, with a bolder habit and longer and finer spikes of larger flowers. They are of a good yellow and bloom for a long time in summer. It is not at all troublesome regarding soil, as I have cultivated it in both a good, rich border and in a bed with exceedingly poor, sandy soil. The colour is a good yellow in the type, but some varieties have been raised with more cream-coloured flowers. The latter may be found under the name of L. macedonica speciosa Nymph. This plant runs slightly at the roots, but is not so free in this respect as some of its sister flowers. It grows from 1 foot to 1½ feet in height, and may be propagated by division or by seeds. As this Toadflax is perfectly hardy no one need fear to secure it. It likes a sunny place.

The Liatrises.—I hear complaints that the Liatrises, or Gay Feathers, do not live very long, and have found the same myself. That most precious Liatris (L. pycnostachya) is an amazingly fine plant and always pleases with its long, tall spikes 3 feet or so high, and with wonderfully handsome racemes of rose-purple. I do not find it long-lived, even in the light, well-drained, sandy soil, which is the prescription given by the medicos of the floral world. I know three others—L. graminifolia dubia, which seems easier, L. scaviosa, and L. spicata, all more or less with purple in the red of the flowers. I have wandered through many gardens hoping to see these Liatrises, but have seldom seen them. They can be divided or raised from seeds, which should form a good means of raising a stock for those who have glass.

Dianthus Pancicii.—I was given, some time ago, a plant of a Dianthus called D. Pancicii. It has turned out to be one of the "long-legged," cluster-headed kind, with stems which are too long for the size of the flowers or flower-heads. It grows about 2½ feet high. Its cluster of flowers is crimson. It is rather difficult to place D. Pancicii in the garden, and the border is evidently the position for it, though I find that in stormy weather the flowers are blown over, and it is a difficult plant to tie up without spoiling its appearance. Anyone who wants to try this Pink is advised to secure seeds and to sow these under glass.

Saxifraga longifolia.—Like many other flower-lovers, I fell a victim, in my ignorance and youth, to the beauty of the symmetrically formed foliage of Saxifraga longifolia, not knowing that the rosette died after the flowering was over. A season or two elapsed before my plant flowered, and when it did I was delighted with the magnificence of the spire of flowers, which, unfortunately, was the dying song of the plant. I managed to save a little seed, but as the plant had been grown in proximity to other encrusted Saxifrages the seedlings did not come true to S. longifolia. Unless one has plenty of room and can keep the seeding plants well away from other silver Saxifrages one cannot expect to secure the glorious true S. longifolia.

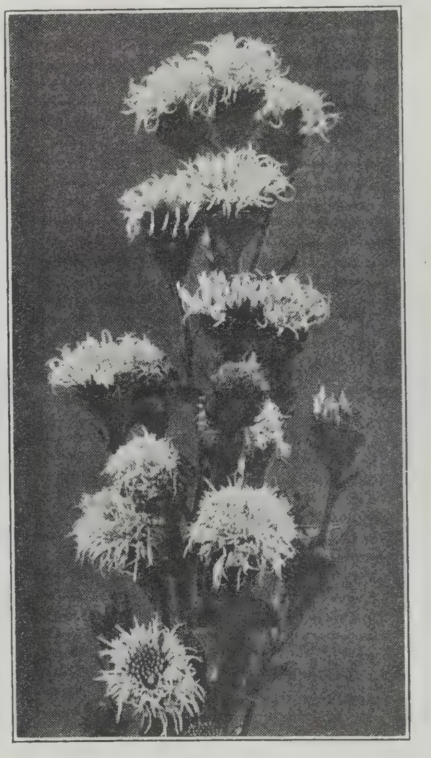
An Amateur of Hardy Flowers.

Transplanting Pyrethrums

There is no more effective dwarf-habited hardy flower than the Pyrethrum, but it must be in full health and vigour if its decorative worth is to be fully recognised. In order to have this useful flower in the best condition it is absolutely necessary that certain cultural rules be observed or the growth will not be sufficiently strong to admit of the production of flowers of the highest quality.

As one sometimes sees Pyrethrums they are hardly worth the ground they occupy, whereas under really good culture they impress by their beauty. Those who wish to make a feature of this fine hardy flower should begin by thoroughly preparing a suitable rooting medium. The soil must be stirred to a depth of 18 inches and well sweetened, adding some partly decomposed manure, or, failing that, any kind of decomposed vegetable matter such as accumulates in gardens generally.

The safe time for transplanting is limited and cannot be done without danger after the beginning of September. Needing a considerable quantity of flowers for cutting, I purchased 100 plants in the latter end of that month. I planted in the beginning of October, thinking that I was doing quite the right thing; but I was wrong. It was courting disaster to move them at that time of year. Unlike herbaceous plants, generally, Pyrethrums do not make fresh roots. All through the autumn months the old leaves decay, no new ones form, and the roots, being in a torpid condition, they are totally unfit to resist the vicissitudes of an English winter. In my case I lost quite 25 per cent. of my plants, excess of moisture in combination with cold causing the crowns to decay. They were strong, well-rooted plants, and good market kinds, and had I planted some six weeks earlier every plant would have produced a good crop of bloom. I now make a practice of planting in August, as early in the month as possible, and young leaves appear by the beginning of September. I know that they have formed new roots and, therefore, quite safe.



Gay Feathers (Liatris pycnostachya)

There is no danger of the plant suffering, no matter how hot and dry the weather may be, if they are "puddled" in, as nurserymen term it, that is, filling up the hole with water and covering with soil, which acts as a mulch and holds the moisture until new roots are made. In this way quite 95 per cent. of the
plants can be relied on to bloom we
following year, and will become thor
established. Transplanting may safe
done in early spring, but more labour
volved, as, if the season is dry and
the plants must be well attended in
watering, and, in any case, they will
thoroughly established by the time they
into bloom.

f a warning note.

After the Frost

An urgent week's work (Essex)

ASSUMING that when these notes get into print the great frost will be over, there will be many a

> . . . ." needful job
> That's crying to be done."

And first . . . the flower garden.

This never looks more disheartening than after a long frost, and when it has been as severe as the last one it looks deplorable indeed. Still, spring is almost here, and there is hope everywhere, even in the midst of ruins.

One of the urgent tasks is to look carefully over the rock garden and give a little help to surface-rooting plants that have been almost lifted out of the ground by the buckling of the surface soil through the frost. These will need making firm, and a little good soil should be put round them.

The frames in which plants have been kept through the winter will need overhauling, and it may be a sad task in some ways. All dead or mildewy plants should be removed, and the sashes kept widely open so long as there is little or no frost. Mildew takes a larger toll of plants in frames in damp weather after frost than at any time.

It is quite time to begin sowing hardy annuals and some perennials both inside and out. In the frames Sweet Peas, Antirrhinums (which must have been exterminated in the open), Primroses, Scabious, etc., to name only a few. Outside, as soon as conditions permit, beds should be prepared for sowing such hardy annuals as Shirley Poppies, Eschscholtzias, Cornflowers, and the like.

THE FRUIT GARDEN.—The first thing to be looked to after the frost will be the damage by the birds to the fruit-buds. Pears have been almost denuded of fruit-buds in places, and bush fruit has suffered badly. The final pruning of all these should be taken in hand at once, and where it has been done already some further cutting-out will be found necessary, owing to the loss of the buds on fruiting wood which had been left.

The thinning of the wood on standard Apples and Pears, where necessary, should be done without delay. Where growth is too thick light should be let in by taking out branches right to the point of origin, and not by shortening. If it is necessary to thin Plum trees restraint should be the motto, and any wounds should be covered at once with thick paint, tar, or creosote to avoid the danger of Silver Leaf.

Antirrhinums as bedding plants

Raspberry canes should be shortened to about 4 feet and weak ones to 2 feet, and all tied in. It is assumed all working of the soil among bush fruits has been done, but if any remains the surface only should be turned over or loosened to facilitate hoeing later.

THE VEGETABLE GARDEN.—It will be a late season for getting some things planted or sown. The first thing to be done is to get up the rest of the Artichokes, select the seed tubers, and replant at once. This is usually done on the same ground, as some tubers are certain to be left in when lifting.

The winter Onion bed should be made up by transplanting superfluous ones from some rows to gaps in others. Extra strong plants should be rejected, as they usually run to seed.

Where Onion sets are going to be planted the ground should be worked to a fine tilth, when the sets can be put in a shallow drill 8 inches apart.

Seed Potatoes should be boxed up if this has not been already done, and set in a light and frost-proof place.

The sowing of Lettuce, Brussels Sprouts, and Cauliflowers should be made in a cold frame. It is difficult to get stocky plants under glass, but thin sowing near the glass, with plenty of air, is a good start.

A. Petts.

Violettas

THE Violettas are a beautiful race of miniature tufted Pansies, and, owing to their vigorous constitution and free-flowering, are valuable plants for the rock garden. To many these are more attractive than the larger kind. Indeed, there are few plants of lowly stature that are capable of giving us such bounteous displays over so long a period as these, and their cultivation is by no means difficult. It is true they demand fairly cool soil, but in most rock gardens this can be provided.

Violettas or Miniature Tufted Pansies

On the rock garden they may be used in a cool nook, either to form a tuft under other plants or for their own sake. They look particularly well placed in a bay in the rock garden, nestling between rocks, with their symmetrical flowers of good self colours, and are equally good for edging informal pathways. These graceful flowers are so hardy and free in many soils that there is, perhaps, no need of rock garden luxuries for them. But in this large group of plants there are rare and beautiful kinds which the variety of surface and of aspect in a well-formed rock garden may be very welcome to, and some European plants of this race are very striking.

The following are a few of the more select for the rock garden:—

V. GRACILIS.—A pretty little Grecian Violet, dwarf in growth, with leaves borne on slender stalks forming a tuft. The flowers, ½ inch across, purple, towering well above the foliage.

V. G. LORD NELSON.—This species has the beauty of colour and grace of habit of V. gracilis, and grows and flowers well, over a long period, in ordinary soil. It is much more vigorous than the old form, and the flowers are larger. There is a white form and a pale lavender form.

V. ROTHOMAGENSIS.—A delicate Sicilian plant with many purple and white flowers, and fading to pink, crowding on thread-like stems to a height of 3 inches from close, low cushions of leaves. It is suitable for association with the choicest mountain plants.

V. CORNUTA.—A Pyrenian plant forming dense tufts of foliage and purple-violet flowers on stems fully 6 inches high, which appear throughout the year. V. c. alba is a white form of the type.

V. BOSNIACA.—Although very slender and liable to be broken by rough winds, is thoroughly hardy. It is 3 inches high, has branching stems, and bears a multitude of rosy-mauve flowers on slender stems for several months in succession.

V. ARENARIA ROSEA.—This is a beautiful dwarf kind. It is very pretty when studded with pinkish flowers among its pale green foliage.

V. TRICOLOR NIGER MINOR.—A small, pretty species 3 inches high, fine deep black with a yellow eye. In some soils it may prove perennial, but is usually a biennial, and should be sown every year in late spring.

V. CALCURATA.—A graceful, vigorous kind, possessing all the pleasing characteristics of V. cornuta, but, instead of forming tufts, spreads slowly by underground roots.

V. LUTEA.—A twin-flowered or yellow species which loses none of its charm through being a native.

V. BIFLORA.—A tiny plant from the Alps, with yellow and white flowers.

V. THURINGIACA.—A robust form with yellow and purple flowers.

In so large a family there are, no doubt, many other choice kinds worth seeking by rock gardeners, and not a few fit to be introduced to gardens.

H. Stevens.

Spring flower beds

It is to be feared that a considerable number of gaps will be showing in these, so as soon as weather conditions permit, it will be desirable to make these up, as far as possible, from the reserve garden, and at the same time remove any winter débris that may be present, while the soil should be lightly stirred on the surface with a hoe or hand-fork.

slugs being very fond of it. Sow out-d
in April and later, and water whilst
ing if the soil gets very dry. Much
apt to rot the blossoms. Another ver

wn annual is the common Nigella, called ve in a Mist, Devil in a Bush, and Fennel- wer. The blossoms are of a pretty starch- e. It is suitable for the border, railway bankment, etc., *i.e.*, where one would not d its spreading, as it sows itself rather easily. Sow in clumps where it is to re- in in March and April. My third annual, dy, is Matthiola bicornis (the Night- nted Stock), which should be sown early April. The cross-shaped blossoms are not y pretty, and look shrivelled up during day, but expand in the evening, and the nt is then very pleasing. M.

Plants for a town garden

oo often the town gardener, exasperated, ppointed, and almost despairing, says: Vhat is the use of trying to grow things? y only die."

ut there are some plants sufficiently t-hearted to live and flourish, even when ered with smuts, deprived of their proper d by greedy tree-roots, harassed and aged by marauding dogs and cats, and off from the sun for at least part of the r by house, fence, or foliage.

ere are a few which are putting up a d fight in a small town garden in the nty of Durham.

he common dark blue Monkshood has ived when Delphinium, Larkspur, and in have died. Staked early in the year eaches sometimes a height of 7 feet or eet, covers a fence quite cheerfully, or es good clumps. Kept free from seed- s it flowers from June to late September.

oronicums, Primroses, Snowdrops, Ferns, pe Hyacinths, Woodruffe, Lilies of the ley, and German and Spanish Iris all do , so do Campanulas. C. persicifolia in et season has grown 5 feet high. Clumps it flower from June to November. C. illa covers the garden with a carpet of in June and goes on flowering till the weather nips it. It is encouraged with w packets of bird sand, as recommended Mr. E. A. Bowles. The sand has acted magic on the rock plants. With its aid pusilla alba at last looks contented and py.

he Willow-leaved Gentian spreads further d every year.

uchsia macrostemma (grown from slips er a bell-glass) makes a good show, as it not die down in the winter, and can be at the height required. Planted in tall henware pipes (which are covered with le Arabis, etc., secured by wire-netting) oks well at the back of the border or de the entrance. Veronicas fill up ers if raised into the air and sunshine in same way and given good soil and copious lies of water in dry weather.

he true St. John's Wort grows rapidly is covered with golden blossoms in late mer.

ontbretias, Everlasting Pea, Catmint, pdragons, and the old-fashioned pink rian grow well, the last-named bringing added pleasure of crowds of butterflies moths.

ops make the most satisfactory climber windows and doors. The foliage is tiful, especially if trained horizontally, the hanging clusters of fruit are a pic- in themselves. Sarah Robson.

Half-hardy annuals

veral of these may now be sown, in- ing China Asters, Phlox Drummondii, nthus, Golden Feather, Salpiglossis, lla, Mimulus, Ageratum, Ryburgh d Poppy, Gaillardia, and Zinnia. A perature of from 55 degs. to 60 degs. will nicely.

Lime and its uses

Lime is a highly valued mineral, extensively used in modern cultivations, and while some soils, such as the marly and calcareous soils, need no further addition of lime, others, particularly the stiff clays and those containing a large amount of organic matter, are much improved by occasional dressings. Lime acts in several important ways; it supplies plant food in itself, it sets free other plant foods in the soil, and it acts mechanically on the soil, and when these functions are fully understood it is easy to realise what an important part this element plays in plant nutrition.

Most plants require a supply of lime in their food, leguminous crops taking up more than the general run of plants. As a direct food any form of lime is about equally suitable, but its quickness in action depends largely on its fineness of division, and broadly speaking it may be said that the coarser the grade the longer after application will results accrue. Undoubtedly the quickest in action is burnt or quick lime, but the effect of this is to destroy any tender rootlets with which it comes into contact, hence it can only be applied to vacant land. The chemical composition of burnt lime which has been exposed to water and carbon dioxide is the same as that of ground chalk or limestone, but there is, nevertheless, a considerable difference in their action.

The action of slaking reduces the lime to a very fine powder, and after being acted on by carbon dioxide it is usually in the fine, amorphous state in which chemical activity is greatly enhanced. Ground limestone or chalk, on the other hand, may be crystalline, or the lime may be bound up with silica or magnesia in the form of double salts, and no amount of grinding will render it so chemically active.

Monkshood, flowers deep purple (Aconitum Napellus)

Thus, as one effect of quicklime is to destroy organic tissue in the soil, it would not be wise to use it on soils of low organic content, but on stiff clays and peats it has its advantages because it is chemically more active.

Lime acts as a base in many chemical reactions, which take place in the soil in the preparation of plant-food, and when it is lacking these reactions cannot take place, and elements present remain inert and cannot become available for the plant. Further, all chemical changes which result in the soil being made available as plant food take place best in an alkaline medium, and lime being the commonest alkali available, it is in frequent demand as a corrector of acidity. Intensive cultivations whereby large crops are produced by heavy applications of concentrated fertilisers have a tending to engender acidity, and it is of the highest importance to see that the lime content of the soil is kept at a proper balance. Besides the chemical effect of bringing inert substances in the soil into a condition to be taken up by the plant, lime also exercises an important physical effect by opening up the pores of heavy soils, giving free passage to water and assisting penetration of air, thus rendering the soil more easy to work

Finally, lime is an excellent antidote to many diseases in the soil through its powerful purifying quality. The widespread and destructive Anbury diease, so prevalent amongst Brassica crops, is practically unknown on soils naturally containing a high percentage of lime, and it is the most effective preventive agent known. W. Auton

REMINDERS FOR THE WEEK

Southern and Midland

Mushrooms

Not everyone is in possession of suitable material for the making up of beds these days, but where such is obtainable it should be made use of throughout the season. Elaborate houses are not necessary for this purpose, and a thatched shed at the rear of a north wall which can be kept practically air-tight, or a good cellar, will answer admirably, and if the shed is thatched inside, also, with wheat straw it will be an advantage. After a thorough preparation of the material the beds should be formed on each side of a central path, a brick wall separating the beds from the path. This will not only keep the material together, but prevent undue exhaustion from the sides. The beds should be 2 feet 6 inches in depth. Spawning should take place when the heat of the bed has receded to about 75 degs., the cakes being broken into pieces about the size of a hen's egg. Maintain a temperature of 55 degs. to 60 degs., endeavouring at all times to produce the same humid atmosphere as that of a September night in the fields, when, following rains, Mushrooms are plentiful. Avoid fire-heat if possible, and should the heat rising from the beds prove insufficient, a few heaps of fresh droppings placed along the paths and turned occasionally will assist the temperature.

Early Turnips, Carrots, Express Cabbage

These, also Lettuces, both Cabbage and Cos, Parsley, Moss Curled, should all be sown, the two former in cold frames where they are to mature and the remainder in boxes and raised in gentle heat to supply plants for pricking out on warm south borders later. This sowing may also include Cauliflower and an autumn Broccoli, such as Walcheren.

Land intended for seeds

After receiving a dressing of soot all such land should be forked over in order that sun and wind may penetrate its surface and thus render it fine and workable. This applies especially to plots intended for the main crops of Onions, Carrots, Beet, etc.

Spinach

Make a good sowing of Giant Prickly and Victoria on a warm border and on soil which is in good heart. The rows should be 14 inches apart and the plants thinned, when large enough to handle, to 6 inches apart in rows.

Fruit trees

Complete the pruning and tying in of all trained trees without further delay, and bring forward any arrears of spraying, after which the surface of the borders should be lightly pointed over Planting is still possible, but should be delayed no longer, especially when trees or bushes have to be obtained from a distance, as such trees are liable to suffer seriously from root-dryness in transit.

Early fruit houses

A temperature of 65 degs. will be necessary at night. Frequent dampings of floors and borders will also be necessary, with overhead syringing twice daily when sunshine is plentiful, except during the period of bloom, when a slightly drier atmosphere must be the order. Vines in bloom should be gently tapped about mid-day to disperse the pollen, but Peaches—unless one has abundance of bees near—should be fertilised by hand, using a rabbit's tail.

Arum Lilies, Cinerarias

These and similar plants which are now developing their flowers should be assisted with applications of liquid manures, and the same applies to stove and greenhouse evergreen plants.

Caladiums

These are very ornamental and much appreciated for indoor decoration, and if shaken out and placed in boxes of leaf-mould and sand will quickly respond if stood in the propagating house or stove. They may then be potted up singly in a mixture of loam, peat, and sand.

Polyanthus

A sowing of these charming spring flowers made now will provide fine plants for furnishing the beds in autumn. A sowing may also be made of a good strain of Auriculas.

Carnations and Sweet Peas

Any which have been wintered in cold frames should be given abundance of air whenever possible, as these must shortly be planted out in the open.

Gladiolus and Montbretias

Make plantings of these in the open border. The best effects result from grouping a small number of each variety together rather than dotting a bulb, or corm, here and there. Allowance should be made for a dwarf groundwork.

Alpine flowers

These may now be examined and top-dressings applied where necessary. Additions should also be made from stocks wintered in cold frames, as new life is becoming more apparent each day in this department.

Scotland

Belated sowings of vegetables

With February being so inclement it is to be feared that the sowing of early crops out of doors is to be very seriously delayed. It is necessary, therefore, to be prepared to seize the first favourable moment to get in Broad Beans, early Peas, and Parsnips. There is no advantage, however, in rushing these in while the soil is sloppy, it being worth waiting until the ground is moderately dry and workable.

The Brassicas

Next week is a favourable time for sowing the main crops of Brussels Sprouts, Cabbages, Cauliflowers, Borecoles, autumn Broccolis, and Savoys, should climatic conditions permit. While it is hardly possible to find room in frames for these (should the weather be bad), it is an excellent plan to sow more Brussels Sprouts and early Cauliflower under glass for fear of accidents should the outdoor sowings be unduly held back. By sowing these now in boxes, placing in gentle warmth, and, when ready, pricking into a cold frame, fine plants will be ready by the middle of May for planting in their permanent quarters, which will ensure that the "Sprouts," in particular, will be able to produce a fine crop.

Leeks and Onions

The main crops of these indispensables should be sown on the first favourable occasion, both requiring a longish season of growth. The Leeks may be given a spot on an early border so as to ensure the plants being fit for transplanting in good time, while the Onions should have an open, sunny
tion, with deeply worked and richly man
soil.

Shallots

Like so many other crops, the plantin
this useful vegetable has, in many cases
to be carried out. Delay in planting
not materially delay the ripening of the
but, as a rule, the bulbs of the late-pla
are smaller.

The planting of Rhubarb

While this can be successfully plant
various times it will be found that ear
March gives as good results as any
season of the year. Being a gross f
and having to occupy the same position
number of years, it is very desirable tha
site of the new plantation be well prep
It ought to be trenched, or at least d
dug, and a very generous dressing of
farmyard manure worked in as the

Lachenalias

O apology is needed for a further reference to Lachenalias at this time of the year. In the issue of February 2nd at- ion was called to Lachenalia pendula, the iest of the family to bloom and quite dis- t in its coral-red colouring. This old ourite is usually at its best from about the week in December until the middle of uary, and by that time its successors in to show colour, so that it is possible to ow the red Pendula with a continuous eant of crimson and gold for a further or eight weeks with ever-increasing rest and attraction.

one knows Lachenalias at all it is pro- le that Nelsoni, Luteola, and Tricolor the most familiar, but these are now left behind by developments, which are ely due to the persistent work of the late . Joseph Jacob, who raised a very fine in which have been grouped under the ne of the Whitewell Seedlings (it will be embered that the Rev. Jacob was Vicar Whitewell), and it is by means of selection n this group that most of the finer- ned varieties have come. The cultivation he Whitewells has been further developed h great success by the late William uger, of Guernsey, who probably possessed finest collection of Lachenalias to be nd anywhere, and whose seedlings year by r invariably produced some advanced and inctive specimens; happily, that collec- has not been dispersed, and the work of elopment continues. The strain is repre- ted by some very striking varieties—selfs, olours, tricolours, and quadricolours, with orous spikes 12 inches to 16 inches long carrying 16 to 20 bells, sometimes more. is difficult to imagine more beautiful ouring than in Sunset, which is Indian- ow shaded with red, and the mouth of the e heavily bordered with ox-blood red, the s very campanulate and the foliage well ttled; or Rainbow, gamboge, with dinal suffusion, the lower petals grass- en with plum-coloured lips, a gorgeous iety not yet very plentiful; or Glow, a chrome-yellow, the top of the spike be- tipped with madder-red, and with culated foliage and stem, and one of the st specimens the writer has ever seen was a pan of Siam, a grand yellow self which was in full glory for several weeks; the accompanying illustrations show typical examples of the strength and beauty of these newer varieties.

The bulbs are small, and a 6-inch pot will accommodate half-a-dozen quite well; a dozen in a 9-inch pan makes a fine show and are striking as a house decoration.

The salient points of culture are:—First, the compost, which should be equal parts of good yellow loam, peat, and leaf-mould, with a generous helping of coarse sand. Second, early potting; the best results are from bulbs potted up not later than the end of July, and so assured of a long period of growth; an important accompaniment to this condition is that the drainage must be perfect, and may, perhaps, occupy more space in the bottom of the pot than would be the case with some other subjects. Third, careful watering; enough, but not too much during the period of growth and flowering; when the bloom is over, the foliage should be retained as long as any life remains, so that the bulbs may store up all possible retreating sap as the leaves gradually die down, and then the pots should be placed on a top shelf in full sun and given a good baking to ripen the bulbs; they may remain in the dust-dry soil till shaken out to be repotted in July.

The Lachenalia is a native of South Africa, and was introduced into England about the middle of the 18th century; it is not quite hardy enough to stand the English climate out of doors, and is, therefore, a plant for the cold house or for a frost-proof frame; anything below about 35 degs. is likely to be troublesome to it. In Guernsey many thousands of bulbs grown from seed to flowering size spend the winter in cold frames under the shelter of a south wall with the added protection of matting on threatening nights.

Lachenalias are delightfully interesting, and deserve to be better known, especially in view of these more recent introductions; they are well worth adding to a collection of bulbous plants, but they should be ordered in early summer and not left for inclusion in the general order for Hyacinths, Narcissus, etc., later on in the year, because of the early potting which they require. Some quite distinctive varieties are now to be found in the lists of several bulb specialists, and besides those already mentioned such outstanding ones as Aurea and Leiden among the orange selfs, or Rutland, Monte Carlo, and Goldfinch among the more variegated, are, perhaps, best grown separately; but a good batch of mixed Whitewell Seedlings is pretty certain to produce attractive surprises and to give some specimens equal to varieties bearing distinctive names.

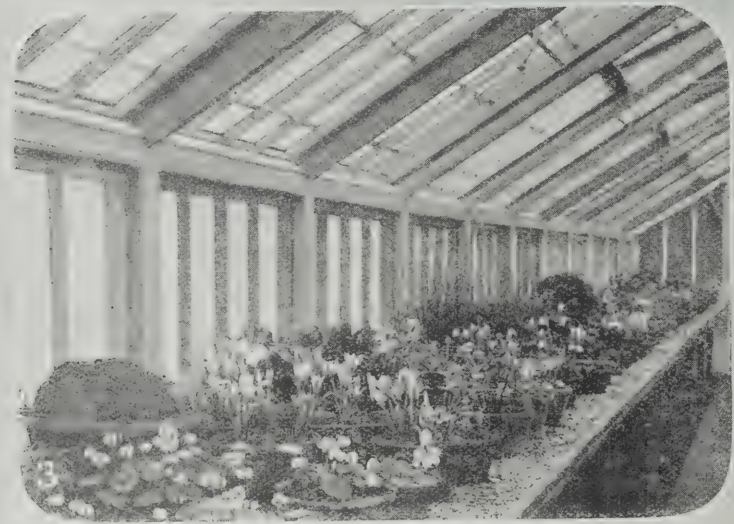
Lachenalia Siam, a grand yellow self



EARLY FLOWERING ALPINES AT KEW

1. The crocus mound.
2. Crocus versicolor picturatus in pan. Flowers white, heavily marked and feathered maroon on the outside.
3. The Alpine house, full of mountain treasures in pans, is well worth a visit at the present time.
4. Bulbocodium vernum in the rock garden, flowers naked purple.
5. Cyclamen Coum album in pan.
6. Galanthus plicatus in a rock garden pocket.

Kew in Winter

LTHOUGH to many it may appear early in the year for a visit to Kew to be really enjoyable, it was with a great deal easure that I spent a short time there e afternoon of February 10th last. In pen were some bold groups of the se Witch Hazel (Hamamelis mollis) its sweetly scented golden-yellow rs, Snowdrops were showing white in rass under the trees, and here and there of the Hellebores. The day was, how- too cold for much time to be spent in pen, so a visit was made to the Alpine- . Pans of Iris reticulata and its paler y, Cantab, were charming. Crocus i and the chocolate and gold Susianas, men repandum, Bulbocodiums, and ila vulgaris var. cœrulea (a good y-blue) made lovely little splashes of . Some good Miltonias were out in rchid-house, but a real feast to the eyes the lovely group of Hippeastrums in g shades of red. Azaleas (yellow, red, orange), some of the smaller-flowered odendrons, and in the same house dils, Hyacinths, Primulas, Camellias, Citron in fruit completed a very charm- icture. A stroll through the Cactus- and a visit to tropical Aroids made one t forget that it was a nasty, cold ary day in London. A. L. WARNER.

lect dozen of the newer Roses for spring planting

advent of longer days, and with them conditions for planting, brings us once to thoughts of Roses. We know the vourites well enough; and there is still for them in our gardens, for many of are indispensable. The newer kinds e more careful selection. There is no ozen varieties, for many kinds that are able in the south are not so reliable in rth, and vice versa. The following selec- nowever, judging from my own experi- with them combined with reports from localities, can be relied upon to give ction.

T SILK.—Although this is not exactly Rose, it is of comparatively recent uction. Year after year it increases in rity, and it seems as if too many trees be budded of it to supply the great d. It is a very sweetly scented variety ly colouring, typified in the appropriate and the blooms are shapely, even they are rather short in the petal at The foliage is handsome and the stems devoid of thorns.

. A. R. BARRACLOUGH.—Here we have r glorious pink Rose of quite another It is a sparkling colour and very ul in sunlight. The blooms are of ex- form, borne erect on long stems, and a good habit. I consider this the best colour and good both for exhibition and tive purposes.

GARET MCGREDY.—A wonderful grower ne foliage and an ideal bedding habit. rilliant in colour—geranium scarlet— seen at its best when massed. It has of the rich colouring of the Queen dra Rose, but a much more erect habit is variety.

MAN LAMBERT.—The best of the bronzy shades. A very strong grower with rge foliage that is perfectly free from ease. It does not die back in winter. lour is best in sunny weather, and the blooms and half-open flowers are very ul. It has a fruity fragrance.

MAY.—A dainty little gem of the Mme. Butterfly colour and form. It is almost like a deeper coloured Mme. Butterfly in miniature. The blooms are very freely produced and very shapely. It has a good bedding habit and makes a fine show when massed.

CHARLES P. KILHAM.—Somewhat variable in colour during summer, but especially good in autumn. The rich shade may be described as deep orange-cerise. It has an excellent habit and is a good bedding and decorative Rose.

MRS. BEATTY.—A finely formed yellow that approaches the Marechal Niel colour. It is rather short growing, but the habit is good and not by any means stunted. Besides being very well shaped the blooms last well and make good specimens for exhibition. It is paler than Mabel Morse.

REV. PAGE ROBERTS.—Another fine yellow that somewhat resembles Marechal Niel in colour. The habit is dwarf and compact and it makes a splendid bedder, while it is also reliable as a standard. It is free from mildew and possesses fragrance.

SIR DAVID DAVIS.—This is a strong growing crimson variety that gives shapely deep glowing crimson blooms. These are carried erect on long stems. As a garden and exhibition Rose this is one of the best of the newer crimsons. It is very free flowering.

DUCHESS OF ATHOLL.—I am very fond of this beautiful orange, which is very shapely in all stages. The buds are long and pointed, and these open into full flowers of good form and possess good lasting qualities. It is a capital grower and the foliage is clean and healthy.

PATIENCE.—This is a very reliable Rose for all purposes. The colour is distinct, a kind of scarlet lake on an orange ground. The blooms are very pretty in the bud stage and the open flowers are full and shapely. It has a neat, compact habit and makes a fine bedder.

DESMOND JOHNSON.—A delightful decorative variety of most pleasing colours. The predominating shade is orange. This is suffused with scarlet and claret. Almost every bloom is shapely and the buds are very pretty for buttonholes. The habit is dwarf and compact, and the flowers are freely produced. In autumn it is most beautiful.

NORMAN LAMBERT.

The Winter Aconite (Eranthis hyemalis)
Flowers bright golden yellow in February and early March

Bulbophyllums and their Allies

(Continued from page 130)

One of the distinguishing features of the Order Orchidaceæ is that in all species the third petal, the lip (labellum), is more or less specialised to attract and guide some particular insect species to fertilise the flower, in many cases such specialisation preventing the entrance of less favoured insects, though to them the flower may have attractions.

B. BARBIGERUM is possibly the better-known of the section with haired lips. The flattened pseudo-bulbs creep close to the compost and give rise to lateral spikes, which often carry a dozen flowers remarkable in that the labellums resemble a soft camel's-hair brush, dusky-brown in colour, and considerably larger than the small, pointed sepals and petals. The least movement in the air sets the "brushes" in motion at different angles, so much so that it is a trial of patience to accurately photograph an inflorescence or to hold the plant in the hand and get all the flowers quiescent.

Saltatorium, "the dancing Orchid," obtains its name from the same peculiar motions. It differs from barbigerum in its erect spikes, which, though only 3 inches or 4 inches high, carry eight or 12 blooms. The bulbs, too, are quite different from those of barbigerum, though both species are natives of the West Coast of Africa.

Tremulum, from North India, more resembles saltatorium, but the spikes are 10 inches or 12 inches high and carry many more flowers, the hairs being much darker in colour.

Penicilium, from Burma and probably North India, also resembles barbigerum in its mobile tufted lip, but there the resemblance ends. The bare portion of the peduncle is erect, but the rachis curves and bends over, becomes swollen, and, as it were, sprinkled with flowers having narrow triangular sepals of pale yellow streaked with dark brown. The lip is highly mobile, but as the flowers are adpressed to the swollen rachis its movements are not as apparent as those of barbigerum. As the hairs are of varying lengths it may be likened to an ill-used brush. In colour the rachis is a dull brownish-grey, and altogether the inflorescence has a sad-looking, depressed appearance.

Grandiflorum, a New Guinea species, produces erect spikes, often nearly a foot high, carrying a single bloom only, but that is remarkable for the size of the dorsal sepal, which is 4 inches or more long, broad in proportion, and snake-like in its coloration of green and white. It completely "hoods" the small lip and petals. The lower sepals are nearly as large as the upper, green suffused with brown, and so twisted as to bring the under-surfaces uppermost.

Micholitzii, also from New Guinea, rivals it in size, but the scapes are shorter and the colouring slightly different.

Lemniscatoides (Javanese) and lemniscatum (Burmese), though differing in structure, superficially resemble each other in that the scapes are first erect, then droop, carrying numerous small flowers with ribbon-like appendages white marked with dull rose. Both are among the small-growing species, but when in flower more than attractive.

In Medusæ each flower is small, creamyellow, with a few red spots, but two of the sepals are lengthened into threads 3 inches or more long, and as the numerous flowers are compacted into a close "head" and the threads naturally twirl in all directions, the allusion in the name to Medusa's tresses is not without reason.

A form is known from Sumatra without spottings and with creamy-white colouring. Mirum, also from Sumatra, excites curiosity, and is highly attractive. Small and close-growing, only two flowers are carried on a scape, but they are extraordinary in structure. The two lower sepals have their edges joined, forming a straight, sharply pointed canoe. The upper sepal, small and shield-shaped, is flattened over the minute petals. These bear on their outer edges a row of red, white tipped, flattened hairs, which project outward and are capable of swift, but erratic movement backwards and forwards. Occasionally the whole number are concealed beneath the dorsal, then, apparently for no reason, few or many are pushed forward and outward, resembling oars used by an absolutely untrained but enthusiastic boat's crew. The motions are most rapid in sunlight and during the warmest part of the day.

Ericssonii, the last of the genus in these notes, though there are many others worthy of mention, is a native of New Guinea. Its near allies are Binnendijkii, from Borneo and virescens, Java. Possibly all are geographical forms, one of the other. Be that as it may, the three species attract attention whenever shown. B. Ericssonii has erect, compressed pseudo-bulbs carrying a broad, dark green leaf totalling a height of 12 inches to 18 inches. The inflorescence often contains 10 or 12 flowers arranged in a wheel shape. The sepals attain a length of 4 inches and taper gradually, the lower being nearly at right angles to the dorsal, and the flowers are so placed that the dorsal sepals form, as it were, the hub of the wheel, and are so curved that their backs touch each other in places, and so afford mutual support, imparting strength and a certain amount of rigidity to the whole inflorescence. Though not brilliant, the flowers are pleasing from the green, yellow-shaded colouring of the sepals and petals, the comparatively large lip being ornamented with a flush of purple-red on a white ground.

Cirrhopetalum is just as varied as its sister genus, and the flowers are even more noticeable, as, apart from the development of the lower sepals, previously mentioned, single-flowered scapes are the exception. The majority carry several flowers, forming a complete or broken circle.

The species vary as much as do those of Bulbophyllum. All are interesting, all are beautiful, so that it is difficult to make a selection of the more attractive. C. picturatum is, perhaps, more frequently seen under cultivation. It is widely distributed through the East, and was introduced as early as 1838, hence it is one of the earliest known. The flowers are carried on a stout, speckled scape 6 inches or more high, and vary in number, but I have never seen sufficient to fill the circle. Each flower is some 2 inches long, yellow shaded with green, the small, hooded, red-spotted upper sepal terminating in a purple hair. The lower sepals have their outside edges slightly volute—a character present in a greater or less degree in many Cirrhopetalums—probably to give greater strength and afford more resistance to the impact of any insect. The lip is bright red, a contrasting shade to that of the sepals.

Roxburghii, an Indian species, is very small, but very pretty. The whole inflorescence can be covered, or nearly so, by a penny, but each flower is daintily hued in yellow and purple, the tiny lip being especially bright.

Fascinator, from Annam, one of the more recently introduced species, bears but a single flower on a scape, but paucity of number is outbalanced by size and beauty. The lateral sepals often exceed 6 inches in length, are comparatively broad at their base, and then gradually taper, dividing at their lips. The general colour is light green marked and suffused with purple. The tongue-like lip is vivid purple and the dorsal sepal and petals fringed with bright purple hairs. Pseudobulbs and leaves are only 3 inches or 4 inches high, so that in comparison the flowers seem almost out of proportion, but in admiring their bright colouring and exquisite shap
could wish they were still larger.

varieties at one time.*

VEGETABLES

Tomato trouble

(F. E. F.).—We have carefully examined your Tomato plant and cannot find any sign of an organism which would be likely to cause the foliage to shrivel. We can only conclude that some cultural detail is at fault. From the growth of the plant sent it appears that they are rather soft and long-jointed. Are they growing in too warm a temperature or a long way from the glass? A cold draught could easily cause the trouble at this time of the year. If water collected on the foliage from any cause and the sun caught such foliage before it was dry the shrivelling might result.

Celery and Leeks

(Inquirer).—We take it that you do not require the full details of Celery and Leek cultivation, but only the earthing-up or blanching process. Celery is for most purposes grown in trenches, the depth of the trenches varying according to the type of soil. When the plants are from 9 inches to 12 inches in height the earthing-up process is commenced. The first earthing is
light one. Any short leaves at the
and near the ground are removed by
them away from the plant; then take
fork and place a little earth loosely
the collar of the plant, taking care th
gets into the centre of the plants.
or so later a little more earth sh
drawn up; all soil used should be br
fine before being placed around the

TREES AND SHRUBS

Arbor-vitæ hedges

(J. A. L. A.).—The orthodox time at which to trim Arbor-vitæ hedges is during late August or early September. Trimming in March is not recommended, because a late frost might mar the young and tender growths. If it be desirable to trim the hedges in spring delay the operation until the third week of April. Growth at that time will be comparatively rapid, and there will be much less danger of damage from an untoward frost.

Hedge of Cotoneaster

I am going to plant a hedge of Cotoneaster Simonsii. The plants are 4 feet high. How far apart should they be put in, and ought they to be pruned back, and how far, immediately after planting? I want the hedge to be thick and even, and, ultimately, above 5 feet high. Please also inform me about a Privet hedge. Should it be pruned back at once or later, and how far apart to be planted? Will you kindly also tell me the name of any plant that will grow under a Fir tree? I mean a low-growing thing to look as much like grass as possible in the distance.

L. E. B.

[To form a close hedge the plants ought to be set at 2 feet apart in a double row

preparing the site well. If they are at all well furnished it will be unnecessary to cut them back severely, but they may be clipped in closely toward the end of August, the best time at which to operate upon this class of plant. Keep the roots free from weeds, and if it be possible to do so give a mulch of half-decayed leaves or of well-rotted manure after planting, in order to counteract the effects of

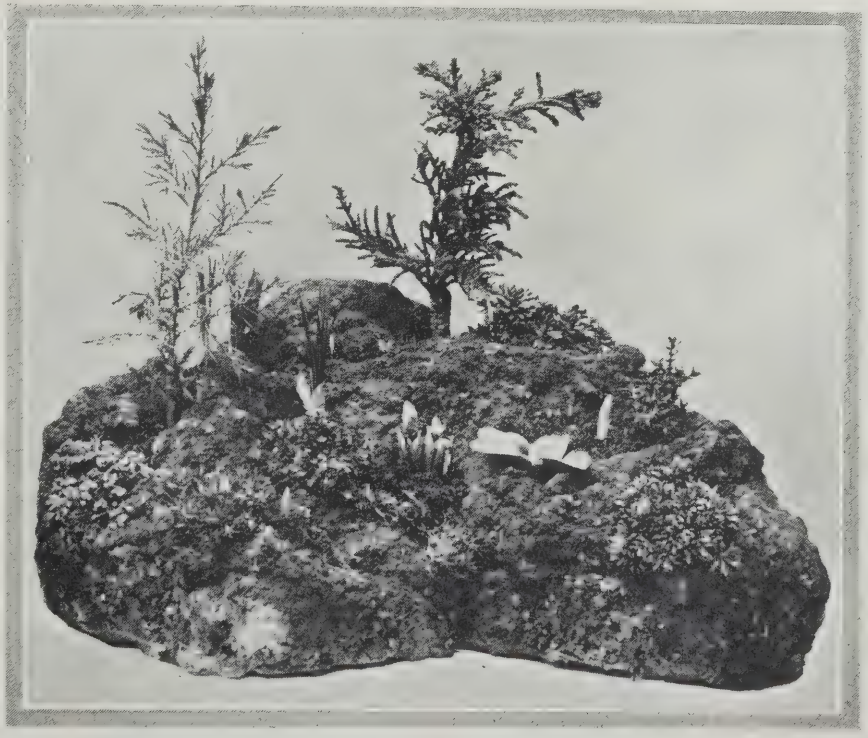
An Alpine garden for the table

THERE is an ever increasing interest in table gardens. These were noted at the great Chelsea Show last May, and have been frequently admired at the R.H.S. Halls during the year. These model gardens are a natural Derbyshire "Tufa," or petrified vegetation caused by the action of the thermal waters. It is porous and no drainage is required as its texture is more like a sponge stone. It is light and the figuring is of such a variety of nooks and crannies suitable for every subject that there are no harsh lines and it has the most pleasing effect. Its colour, too, a beautiful brown, is a change from the cold grey stone usually seen. The interior is quite hollow and allows ample room for planting. The soils required are a mixture of good loam with a liberal quantity of sand, and if a rubber mat is used to stand the garden on it may be used on a polished table. These are an ideal present for an invalid, who can, for example, find much interest in watching an encrusted Saxifrage slowly coming into flower. To water, soak the whole garden in a bowl of water once a week and stand to drain. It is also suggested that when their flowering period is over they may be turned out in the open until another winter. As to suitable subjects, the effect of dwarf spring bulbs is wonderful. Imagine a few Snowdrops, Scillas, Narcissus minima, Triandrus, Angel Tears, also a few dwarf Chionodoxas and the beautiful Grape Hyacinth azureus.

Among the most interesting Alpines for the purpose are the beautiful Rosette Saxifrages, such as Saxifraga Elizabethæ, apiculata, Burseriana, sancta Notata, Aizoon rosea, also a few Saxifraga pyramidalis, cotyledon and Catheramensis; the beautiful Erinus carmineus, Potentilla minima, Linaria aquitriloba, Dianthus alpinus and cæsius, Gypsophila cerastioides and Aubrietia minima; the wonderful variety of Sedums and Sempervivum arachnoideum and montana. Then there are the rock-hugging Thymes, and here I would say that Edelweiss has proved very satisfactory. There are also a good selection of the Mossy Saxifrages and the Arenarias and a few varieties of Veronica such as Bidwelli and rupestrum.

Of course it is advisable to place portable gardens in the open one or two days a week as none of these subjects care for too much tobacco smoke.

ALPINA.



An Alpine garden for the table in natural Derbyshire "Tufa."

possible drying winds during March and April. Privet hedges, in your case, are not to be recommended. Granted, they grow quickly and look neat when newly trimmed, but their roots ramble over a wide area and absolutely impoverish the soil in their neighbourhood. Then, too, they must be clipped, always twice and occasionally three times in a season, if they are expected to have a neat and trim appearance. But if it be decided to plant Privet the procedure above given in the case of Cotoneaster will suffice. Should the Privet plants be lanky cut them back to half their length toward the end of April, and top the resulting growths in September.]

Machine for cutting Box hedges

(J. A. L. A.).—No machine for this purpose has yet been invented so far as is known. In any case it is unlikely that any machine could do the work so neatly or so efficiently as a careful man with a very sharp pair of shears of the ordinary hedging style. Boxwood edges are often quickly cut by means of a scythe in skilled hands, or by the use of the edging shears; but hedging shears make the best job.

FLOWER GARDEN

Lilies in Southern Oregon

(W. A. B.).—The Lily you have seen growing wild in Southern Oregon, U.S.A., is, in all probability, Lilium Pardalinum, which grows in that district, or it may be Lilium Humboldtii, but if you are able to grow the Lily well in this country in your own garden then it is far more likely to be L. Pardalinum. We are afraid that you have been confused by the statement in the article and under the photograph " Lilium testaceum, of unknown origin." This, we should explain, refers to the fact that the hybrid is of unknown origin. This plant does not grow in the wild state in Nature.

Gypsophila Stevenii

(Mrs. F. E. Chapman).—This, a somewhat coarse-growing Caucasian plant, resembling, but inferior to, G. paniculata, is scarcely grown outside botanical gardens. Seed of it is, however, offered by Messrs. Haage and Schmidt, Erfurt, Germany. English nurserymen seem to confine themselves to offering the hybrid between G. Stevenii and G. repens under the name of G. x monstrosa. It is a handsome, strong-growing rock plant, which forms foaming cascades of flowers for many weeks in summer, and about 9 inches high.

FRUIT

Cranberries

(Mrs. F. E. C.).—The only Cranberry worth garden room is Oxycoccus macrocarpus, with fine, large berries where it succeeds. It should be planted in a boggy, peaty spot in full sun, and it requires plenty of room to spread out in the loose, tangled mats it soon forms in congenial situations. Messrs. W. E. Th. Ingwersen, of Birch Farm, East Grinstead, can supply this plant.

MISCELLANEOUS

Soil samples

(Inquirer).—We have examined your three samples of soils and find that each contains quite a good reserve of " lime " in the form of calcium carbonate. We do not think that general liming is necessary, but you would be well advised to use a light dressing of quicklime on soil intended for Peas, Beans, and members of the Cabbage family. If you practice a rotation and gradually move the above crops round your garden, and lime the sites for them each year, you should be able to grow these crops well and at the same time keep the lime content of your garden up to the right point. From the description you give of your soil, and from its appearance, we think that if you applied 1 oz. of sulphate of potash and 3 ozs. of superphosphate per square yard you would get better crops. Next winter all unoccupied ground should be dressed with an equal mixture of basic slag and kainit, the rate of application being 11 lbs. of the mixture per square rod. Your garden soils at present contain plenty of lime, but it would be wise to apply 7 lbs. per rod to certain crops to ensure that the lime content of the soil is kept on the right side. If all your garden received this quantity once every four years it should be sufficient.

Insects for examination

(M. J. P., Morecambe).—The specimens sent in are the larval and pupal stages of one of the so-called Fungus-gnats (Sciara sp.). In your case we do not think you can regard the creatures actually as a plant pest because they are feeding upon plant roots. The adult flies are small, delicate, and slender, and are always more or less present under damp and shady conditions. Eggs are laid in fungi, decaying wood, and almost any decaying organic matter. There are several generations in a year. What has probably happened in your case is that after the manure was placed in the soil a few of these creatures emerged from eggs previously deposited in the dung, and under the favourable sheltered conditions of the greenhouse they have increased very rapidly until now the borders are teeming with them. We think that because you have so many present you would be well-advised to kill them off, because no plant could possibly grow where they were present in such large numbers. Apply crude naphthalene at the rate of 2 ozs. per square yard and fork it in as deeply as you can into the borders. Place a few wet sacks over the borders after application to keep in the fumes as long as possible. If the border is dry give a good soaking with water after the naphthalene is applied. We take it that the borders are now empty. Repeat the dressing of naphthalene, if necessary, after an interval of 10 days. Several species of Sciara are injurious to plants.

New lawn unsatisfactory

(H. H. S. Morant).—If you reduce the amount of sulphate of ammonia to one-half (namely, 1 oz. to each square yard) on the renovated sections you will find it quite satisfactory. Much, of course, depends upon the strength of the seedlings, which should be strong enough to take the full dressing, but as a precaution we advise the smaller quantity, which might be repeated at a later date.

Reliable Secateurs

(Amateur).—If you want a reliable sécateur which makes the cuts smoothly and perfectly, especially for Roses, the Guienne sécateurs supplied by Mèdoc and Guienne Patent Sécateurs, Ltd., 25, Spencer Road, Chiswick, London, W. 4, which are recommended, but you must be prepared to pay a high price for them, as they are made from Sheffield steel in France and pay two duties. Also they must be used as directed and kept spotlessly clean, which all edged tools require, when they will last a lifetime. If damaged they can be repaired and made to function as well as when new. The same applies to the Guienne flower-gathering scissors, which are purely Sheffield make. For your purpose the 8¾-inch size is the right one.

Manure for new lawn

(D. K.).—The native guano manure will be quite satisfactory, but owing to the poor quality of your soil we suggest that you mix it with good loam which has been passed through a ½-inch sieve. Using 56 lbs. of the manure to ½ yard (or half a cartload) of the soil, this should be spread evenl generously upon the lawn, which in a short time will show a vast improv Yes, this is a very good manure fo use, but should be substituted aft years by bone-meal or Clay's Fertilis

Entering Kew as a student garde

(G. W. W.).—You should apply di the Curator of the Royal Botanic Ga Kew, and he will send you a form on ap tion. There is no examination, but necessary to have had some years' exp in practical work.

Organic manure

Lately we have had some inquiries as to manures which could be used as substitutes for farmyard manure. Most of our correspondents are in the position of being unable to obtain sufficient supplies of farmyard manure and are, therefore, looking for materials which can be used in conjunction with inorganic manures. We are constantly pointing out in these pages that the best crops are always obtained when the garden manurial programme includes both organic and inorganic manures. This is because organic manures, although comparatively poor in plant food, exercise great benefits on a soil from a physical standpoint. Inorganic manures are rich in plant food, but have little beneficial effect on soil texture. A few of the organic manures which are useful as substitutes for farmyard manure, together with their modes of application, are given below:—

SHODDY.—The name "shoddy" is given to certain materials thrown out in manufacturing processes from wool factories, and is, in the main, made up of strands of wool which are too short to be made up into cloth by the machinery. Two samples are generally available; the first is composed of the material left from the original wool and consists of wool and dirt, the second is the residue left over after tearing up old cloth and working it up into new fabrics. Such samples usually contain a proportion of cotton. The value of shoddy depends upon the wool content, the dirt and cotton are useless. The wool contains organic nitrogen, which decomposes in the soil and eventually produces nitrates. In addition to the nitrates produced the material is valuable because it supplies organic matter which is valuable for the purpose of holding moisture, keeping soil open and therefore obtaining good tilth.

One drawback which sometimes occurs in the application of shoddy is that certain samples are lumpy in character. Such are extremely difficult to apply evenly, and also lumps of shoddy decay very slowly and are liable to open certain soil too much. The rate of application should be from 10 cwts. to 20 cwts. per acre or 7 lbs. to 14 lbs. per square rod, according to the percentage of ammonia present. Some difficulty has been experienced by some of our correspondents in working the material into the soil. It should be remembered that shoddy is largely useless applied as a top-dressing, but that it should be applied prior to digging and well worked into the soil.

Shoddy is of the greatest value on clay and silt soil, but on light sand the shoddy opens the soil too much, especially if applied late in the season. When using shoddy it is necessary to use some other manure which contains phosphate and potash, because shoddy only contains a supply of nitrogen, and if used alone the subsequent growth of crops would not be satisfactory. To balance up the nitrogenous content of shoddy the grower should make up a mixture containing five parts of superphosphate 35 per cent., one part steamed bone-flour, and two parts sulphate of potash. The mixture should be applied at the rate of 8 cwts. per acre, 5½ lbs. per square yard, and 3 ozs. per square yard respectively.

A low-grade 5 per cent. shoddy, *plus* the mixture of inorganics given above, would add to the soil approximately 100 lbs. of nitrogen, 100 lbs. of potash, and 120 lbs. of phosphate per acre.

CASTOR MEAL.—Another useful organic substance which is now available for garden purposes is castor meal, containing approximately 4·5 per cent. nitrogen. Castor meal should be used at about 40 cwts. per acre or 14 lbs. per square rod, and, like shoddy, the castor meal should be supplemented by using the mixture of artificials given under shoddy.

SURPLUS HOPS.—This is another very attractive material, but we imagine not easy to obtain in small quantities such as are usually required for garden purposes. Applications at the rate of 20 cwts. per acre should be useful in maintaining the organic content of any soil. The analysis of surplus Hops when applied at 20 cwts. per acre works out at approximately 69 lbs. of nitrogen, 28 lbs. of phosphoric acid, and 57 lbs. of potassium oxide. To make up a good, complete manure for most soils 5 cwts. of 35 per cent. superphosphate should be added per acre. On light soils a further addition of 1 cwt. per acre of sulphate of potash would be useful.

Enough has been said above to indicate that, apart from farmyard manure and green manuring, it is possible to make up garden manures from various waste organic substances, which, when used at the quantities indicated and supplemented by certain inorganic manures, will give well-balanced manures. If we can assist our readers further we shall be pleased to do so.

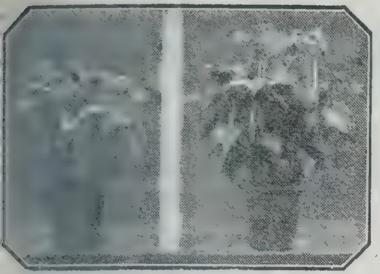
FISONS' FERTILIZERS

Will Increase the Yield of Your Garden



The effect of Fisons' Champion Fertilizer on Beans. Untreated pot on left; treated pot on right.

A SMALL outlay on Fisons' Fertilizers will enable your crops to be increased greatly, blooms improved, and the season extended.

It is most important when feeding Flowers and Vegetables to use perfectly blended, properly porportioned foods. This is secured by using Fisons' Fertilizers.

Expert advice is at all times available, free of charge.

FISONS'

CHAMPION FERTILIZER

for Potatoes and Vegetables.

Dig in 6 ounces to the square yard or 11 lbs. per rod when preparing the ground. Vegetable crops, particularly potatoes, respond so readily to this Fertilizer that the increased yield more than repays the cost of the Fertilizer. Full instructions sent with each bag.

PRICES IN BAGS:	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.

GUIENNE SÉCATEURS

From Lt.-Colonel E. S. Clark
1st *March*, 1929.

"I am much obliged to you for doing my sécateurs ...... When these sécateurs were bought you particularly said they were never to be sharpened by anyone but you yourself. These sécateurs were bought from you about six years ago, and since then have pruned my roses yearly without having been resharpened until now. ***I think they are a wonderful proposition***. At the time I thought they were expensive, but they are certainly worth the money."

Hundreds of like testimonials can be seen at the Show Room and Office of ***The Mèdoc & Guienne Patent Sécateurs, Ltd., 25, Spencer Road, Chiswick, London, W. 4***. The Company owns exclusive Patents of Sécateurs, Flower-gathering Scissors, Pruning and Budding Knives, Registered designs of Pruning Saws, Weeding Irons, and also vends the Medusa sécateur and tree pruners. All these tools are the finest quality obtainable. Nearly all are specially made for the Company. Illustrated Price List post free.

Scions! Scions!! Scions!!!

OF THE

NEW APPLE "B.G."

Owing to the great demand for the "B.G." (Bushy Grove) Apple trees, we have decided to offer

SCIONS at 1/- EACH

in order to satisfy a greater number of persons eager to obtain this variety of Apple.

Grafting wood will be sent out in lengths according to the number of scions ordered. Estimated length of scions average three inches, containing two good healthy buds with sufficient space left for cut to be made.

MAIDEN TREES 15/- EACH

There is not another English Apple on the market that has all the good points of the "Bushy Grove."

The "B.G." received the Award of Merit from the Royal Horticultural Society in 1922. Since then it has been awarded Two First-class Certificates, Three Silver Medals, and one Bronze Medal. First prizes have been secured almost every time the "Bushy Grove" has been exhibited. Orders (with remittance) will be despatched in rotation, as this offer of Scions is subject to a limited stock.

SUTTON'S SEEDS

Annuals for Summer Gardening

THE popularity of these beautiful, yet simple flowers continues to increase, and there are few gardens in which they may not be found. Their wide range of colour and diversity of form and habit make Annuals peculiarly suitable for the modern style of gardening. Flower-lovers who have once grown them continue to do so to a greater degree than ever, while those who have not, as yet, given them a place in their garden, have before them the opportunity of planning many beautiful and harmonious colour schemes for their beds and borders during the coming summer.

A complete descriptive list of the best Annual flowers for summer gardening will be found in the pages of "Sutton's Garden Seed Catalogue for 1929."

The Forsythias or Golden Bell

Invaluable March and April flowering shrubs suitable for planting in groups or masses, and in the case of one or two species admirably adapted for growing on banks, covering arbours or trellis work, and for training on walls

HE genus Forsythia is composed of some
of the most beautiful and ornamental of
spring-flowering shrubs. Belonging to the
ural Order Oleaceæ, the Forsythias are
d to the Lilacs and Jasmines, universal
urites, and representatives of the same
r.

ie Forsythias are hardy deciduous shrubs,
ing in height from about 4 feet to 10
in the open, but when trained on a wall
will grow considerably higher. They
also be grown in standard form. All the
ies have yellow flowers, produced in the
ng on short stalks from the joints of the
ious year's wood; the blossoms are fairly
e, drooping, and varying in number,
er solitary, in pairs, or clusters, accord-
to the different species. The general
t of these delightful shrubs is usually of
lender and graceful character, which
ht be likened to a whip-like growth; es-
lly is this the case in the pendulous
ts of the species F. suspensa.

is genus was named in honour of
iam Forsyth, at one time the King's
lener at Kensington (1737-1804), and con-
of three or four species. They are
ves of China and Japan, with the excep-
of one species, which is claimed to be
European.

l the Forsythias are of the easiest cul-
ion, providing a few needful require-
ts are attended to at planting time. Like
other trees and shrubs, it is advisable
ive the plants a good start at the outset
ieir career, as regards the preparation of
soil in which they are intended to be
vn. They are gross feeders, however,
erring a rich
y soil, which
ld be deeply
ced preparatory
anting. As pre-
sly stated they
be grown in
ps, or massed
beds on the
s, or as single
mens in the
bery borders,
or planting on
s and trailing
rocks which-
position they
growing in a
display of bloom
nerally assured.
look well in
groups or
es, or trained
wall plants; grown thus one can appreciate the full beauty of these most desirable shrubs. Moreover, they can be used by themselves, or in conjunction with some other kind of tree or shrub that will act as a foil, and enhance their beauty at flowering time. When planting Forsythias by themselves, in groups, or masses, a position should be selected having a suitable background of evergreen trees or shrubs, *e.g.*, Hollies, Yews, Cupressus, Thuyas, or Evergreen Oak, especially where the latter does well, as for instance, the South of England, near the coast. Rhododendrons also form a pleasing background, especially if they have attained a good size or planted on rising ground. Moreover, a suitable and pleasing combination might also be made by interplanting a large group of Forsythias with Cupressus Lawsoniana or Thuya; the dark foliage of these trees would make a most pleasing contrast when the shrubs are in flower during the spring. The propagation of these shrubs is readily effected by means of cuttings made of half-ripened wood of the current season's growth, which root almost as freely as Willows; consequently, the stock may soon be increased. By raising a few plants occasionally, and growing these on, one may always have a few plants at hand in readiness for future planting.

Forsythia suspensa has been in cultivation in this country since about the middle of the last century. It is a native of China, but was first introduced from Japanese gardens to Holland, thence to this country, several years later. It is one of the finest of the yellow early-flowering shrubs, of a spreading or rambling habit of growth, the branches being pendulous, or hanging down several feet in length. In the open it grows some 8 feet to 10 feet high, but when trained on a wall it will attain 20 feet or more in height. There are two distinct forms of this species in cultivation, viz., Fortunei and Sieboldii. The former is of a more vigorous and erect habit of growth than the type, the latter having slender, pendent shoots with a general tendency towards a trailing habit. They may all be pruned hard back in the spring, immediately the flowers are over. The golden yellow flowers of F. suspensa are produced in varying numbers from one to as many as six in a cluster on last year's wood in March and April. It goes under the common name of Golden Bell.

Another Chinese species, F. viridissima, has more erect and stiffer branches, growing to a height of 5 feet to 8 feet. It was introduced by Fortune in 1844. Perhaps not so good a shrub as F. suspensa, nevertheless, it is a useful one, and a decided acquisition to the garden. It flowers a little later than the latter species, and is also of a more sturdy habit, sufficient to hold its branches erect. The flowers are a bright yellow colour.

There is also a hybrid form called F. intermedia, a supposed garden hybrid between F. suspensa and F. viridissima; it is intermediate between both parents as regards the manner of its growth, and the shape and form of its leaves. It is a beautiful and handsome shrub, and in no way inferior to F. suspensa, a most desirable subject for planting in groups

A spray of Forsythia intermedia denisflora, with masses of deep primrose-yellow flowers or masses. It flowers a little later than F. suspensa.

The following are three varieties or forms of the above-mentioned hybrid: densiflora (see illustration), a distinct form having flowers more densely crowded on the shoots; the variety called spectabilis is a seedling form with larger, deeper yellow flowers, and produced more abundantly. It is a remarkably fine shrub and makes a splendid group, or it may be used as a hedge plant, for which purpose it is equally suitable. The other form, Vitellina, is of a more erect and sturdier habit of growth, with flowers of a rich dark yellow.

All the above mentioned Forsythias are most desirable shrubs for cultivation in large or small gardens. They produce a wealth of bloom during March and April, the flowers lasting a considerable time, which in addition are of great decorative value.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Sisyrinchium grandiflorum

ANYONE reading Nin-Nin's description of this beautiful plant in your issue of February 23rd will be tempted to add it to their collection of rock-plants. I have had a clump of it for 13 months or so, and last March its 6 inches of growth adorned with such beautiful reddish-purple flowers was a picture in itself.

It was greatly admired; and the outcome of this admiration was that in the true gardening spirit I had to part with a piece.

According to "Thompson's Gardener's Assistant," this plant thrives in a peaty soil; and much more freely in Scotland than it does in the South. JOHN W. HALL.

Edinburgh.

The Suggested Society of Landscape Architects

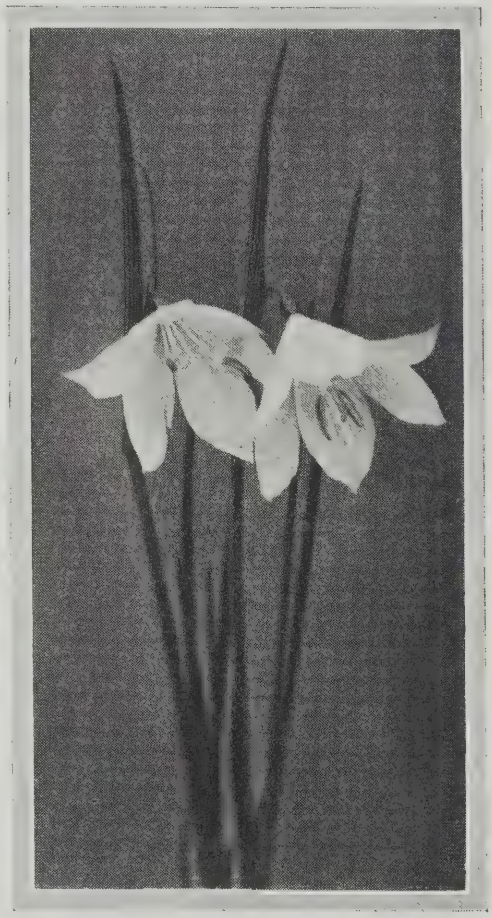
Whatever may be said for or against the formation of such a society as has been discussed in your columns, it is certain Mr. Mawson's objection to it, issue February 16th, p. 101, will not bear investigation. Apparently he would wait until some wealthy patron can be found to endow a chair of "Landscape Architecture and Civic Art," at either Oxford or Cambridge. Surely if his school is desirable it is more likely to be achieved by the collective influence of a society genuinely representative of a profession that has been practising several centuries, than by the chance opportunity of one member of that profession being able to influence a wealthy wellwisher to provide the money.

Some centre of education for those who desire to practise the art of garden making is undoubtedly desirable. At present there does not exist in Britain a satisfactory institution to which a student can be sent to acquire even the necessary technical instruction. It is, however, open to grave doubt if the theory and formula of a university curriculum would serve to produce a good designer of gardens. To one with a natural aptitude for design such a course should certainly prove beneficial, but I think we all agree with Ruskin, when he says, "Design cannot be taught."

What is lacking is a centre in which the student may be educated in the technical and practical methods of applying the art that is in him.

As things are to-day, probably the best method of acquiring the requisite knowledge would be a term of three years with an architect and surveyor, three years in a first-class nursery, and three years in two first-class private gardens. I would add a term in a public park, but the study of these is open to all at any time, and could be concurrent with the others.

You will notice that I suggest it is necessary to spend twice the period in the study of Horticulture that would be allotted to acquiring a knowledge of draughtsmanship, surveying, etc. This is indeed essential. It is possible to acquire a sufficiency of the technical knowledge in the time named to enable the student to survey and plot a site, and if he has the natural ability, to prepare a paper design for its development. On the purely horticultural side, he will at the end of the period allotted find himself only *beginning* to acquire an intimate acquaintance of the vegetation he will have to use; and how to use it.



Sisyrinchium grandiflorum album, with pure satin white bells and Iris-like leaves

Too many people run away with the idea that the capacity to present a pretty drawing constitutes garden design. A man may make good bottles, but know, and care, nothing about the wine they are to contain. Nor is he responsible for the contents. A garden cannot be designed on these lines, nor can the designer shirk the responsibility of its being suitable for the purpose for wh is intended.

For these reasons I do not believe class room education would ever prov tirely satisfactory or sufficient. The al tive is one that I have in my opti moments dreamed might materialise day. It is of a country estate being deve as a school for garden design and land gardening. Here the necessary indoo struction could go on concurrently wit outdoor, and practical demonstration given of all the elements of garden ma together with education in allied and gous subjects. The classroom would ha place, but its utility would be subordina the practical teaching on the ground ou As this presupposes a sort of combinati Kew Gardens, the R.H.S. garden Wisley, and a technical college it is, I likely to remain just a dream. The Ho tural trade could, if it would, and wo it could appreciate its value and signific in its own interests create and sustain s centre.

The reason the proposal to form a S of Garden Architects (or whatever they s be called) has met with a certain am of adverse criticism is, I believe, due fact that it is feared that it may de into a society of plan draughtsmen and else. It is an unfortunate fact that are being turned out into the cold to-day a number of young men and w who have had the experience of two or years in a drawing office as pupils, a other. Having completed their term are—well, what *are* they? They ar architects, and never intended to be i sense of being designers of building which they have had neither the desir education. They are not gardeners be many of them have but the scanties

This is a souvenir that all garden will appreciate.

intance with even common garden plants, ond a " Catmint, Lavender, and clipped v " knowledge. They are just as liable prepare elaborately a chalk pit for the eption of Heathers that hate lime as not. ey may even, through natural ability and tudy of the elementary principles govern- all design, be good designers, so far as ir knowledge goes. But, successful den design is more than the invention of terns. The argument used by the archi- that he should plan the garden because many gardeners know nothing of design justifiable. The argument the gardener s that the architect should be excluded n the garden because he knows so little the material that is to occupy the area qually authoritative. Neither the architect the gardener who follows his calling ally and thoroughly has any time to give the study of the other profession. The nion of the architect that the gardener uld be called in to plant a garden much a painter is entrusted with the decoration n room is absurd. Paint does not grow. es, shrubs and plants do, and their sent and future welfare constitute ele- nts of garden design just as much as the angement of paths, planting areas and the other component parts of the garden. he designer of gardens does not need to w *all* the architect should know. Nor s he require to possess *all* the experience the good gardener. Sanitary systems, nestic heating crocking pots, propaga- n of plants, trees and shrubs are not ential items in his education. The pre- ation of drawings that will illustrate his gramme of operations to workmen, the urate piecing together of the elements the garden he is designing, the know- ge that the soil will support the vegeta- n he introduces, and that the vegetation lf will prove neither ineffective nor over- elming, *are* necessary.

o few gardeners recognise the point at ich they would be wise to have the istance of the architect. So few architects e ever recognised that there is anything re in gardening than merely furnishing a nework of their conception, by contract otherwise. Rarely do they think of lay- their plans frankly before an expert rticulturist on a consultative basis, and ept his criticisms even of the details of ign freely. Usually they make their mis- es, and trust the gardener will cover them by contract. In consequence they often contractors' planting—and deserve it.

t is a link between the two professions, quately and efficiently trained, that might produced by the school Mr. Mawson de- s, and such a link would ultimately pire confidence in both. I do not think a oolroom training alone would be any ter than a drawing office apprenticeship. ctice and theory, art and science must together to be effective.

society such as proposed may—or may —tend to the furtherance of the course nave outlined. If the society makes an rt in such a direction some good will be ieved. In any case if a number of men women choose to band themselves to- her for their own and the common good, ardly think the criticisms levelled against h a course by contributors like F.R.H.S. ighton) and others outside the profession worthy of notice. No association that ever formed with an earnest desire for improvement of its members either in- idually or collectively has ever proved rely futile. That membership of such a ety is likely to add any lustre to the vidual is more than doubtful, and ought to be considered.

notice one statement in Mr. Mawson's letter that I do not take as advocacy of the pursuance of a similar course here. It is that " in America the universities are pouring out something like 100 graduates in the Art every year," *i.e.*, a thousand in ten years.

Much has been written about the proposed society conferring " dignity," " standing," on its members. The names of Perault, Le Notre, Bridgeman, Kent, Wise, London, Brown, and Repton, would have acquired no added distinction even had they all been living at the same time and formed the council of such a society. What might have happened if they had all been able to meet occasionally in an endeavour to counteract each others' opinions would be interesting to know, but it is probable neither they nor the building they occupied would have survived the first meeting. GEO. DILLISTONE.

——Your correspondent, M. L. W. (p. 118), would have all gardens to be the reflection of the mind of their owners, and therefore to be designed by them, and developed by degrees, and no doubt in many instances this would be very desirable. Those who remember the garden of the late Canon Ellacombe would have an excellent example of this. In these days of expansion of opportunity and ambition, and where the owner desires to create his garden under his direction, and if haply he comes by a garden designer who is not only able to interpret his conception of a garden, but able to guide his knowledge and judgment to his satisfaction, the result will often be desirable. We see most of what your correspondent refers to as " reach-me-down gardens " among the smaller plebeian kind, where scope for talent is absent, and the crazy pavement and the stucco statue is found. And then how often the most satisfying part of the garden has been due to the inspiration of the designer, which came to him on the spot, and the possibilities were revealed little by little and required time to disclose the best which could be obtained, and where a pre-conceived plan was necessary, has had the effect of stilting the wishes of the designer, to the detriment of the whole.

St. Leonards.

Coloured Primroses

In your issue of March 2nd G. T. Coombs writes that he found a pink Primrose growing amongst the ordinary yellow ones in a Surrey wood, and asks if anyone has come across a similar find. Last year, in a wood bordering on our property, whilst gathering Primroses (of which there is an abundance), one root of lovely pink blossoms was growing in the midst of the yellow variety. This wood is a long way from any garden. I dug up the plant and removed it to my own garden, where it now is, and I am waiting to see if it will again produce pink flowers or revert to yellow. In this same wood, after Primroses come the wild Hyacinths (Bluebells), most of which are blue, but we often find white and pink bells.

The lawn garden, Legbourne Abbey, Lincs.

The lawn garden at Legbourne Abbey

THE present house, known as Legbourne Abbey, stands on the site of an old Lincolnshire monastic establishment, but no part of the Abbey remains.

The gardens there are not extensive, but there is an undoubted charm about the beds dotted about the lawn, the colours standing out vividly in contrast with the emerald turf, whilst additional beauty is conferred by the judicious placing of pedestal vases well stocked with flowering plants around the edge of the lawn.

The general effect is enhanced by the background provided by the beautiful trees in the parkland beyond. H. W.

Double-flowered Primroses

There are certainly a large number of keen gardeners who take a great interest in these old-fashioned flowers. Unfortunately, great confusion exists in the names of varieties, and as collectors know, one constantly gets the same variety under another name. Sanguinea plena, otherwise Red Paddy, particularly seems to be known by many names. Even so, however, I have come to the conclusion, after much searching and inquiring, that there are still in existence at least 25 or more varieties of the double Primrose, counting those that rise on a Polyanthus stalk, such as Prince Silverwings, Dernclougbi, and Curiosity. There seem to be at least six different kinds of yellow and three different shades of French grey. I have heard of an exquisite new double blue of which one of our great gardeners wrote recently: " Dr. McWatt showed at Chelsea last May a little bunch of a very fluffy sulphur variety of his own raising, and he told me that this spring he hoped to flower other home-raised doubles."

How instructive and delightful it would be if we could get together as many doubles as possible this spring and hold an exhibition of them, say, at one of the R.H.S. fortnightly meetings. Perhaps a few of the Irish ladies would come over, or send some of their rare beauties for us to see. If this suggestion meets with the approval of any of the double Primrose enthusiasts and anything comes of the idea I would be glad to help in every way possible. FLORA HARDY.

Knockholt, Kent.

Early Daffodil Cervantes

THE enclosed photograph is of three bowls of Cervantes Daffodil which I thought might interest other amateur growers. There are 12 bulbs, grown in Moss, which have produced 46 flowers. I planted them on September 16th, and till January they were in an unheated room. When the buds began to show I moved them to a " moderate " greenhouse, and the first flower came out on February 2nd. It shows the superiority of good bulbs when an amateur, with a little care, can get such an excellent result.

I think it is easier to regulate the watering with bulbs grown in Moss than in fibre, and after they came out of the dark I always covered them on cold nights.

WINIFRED L. CORRY.

Annuals of California

Upon running over the list of annuals in A. L. Warner's article, issue January 19th, on " Flowers from Seed," I note that many of those mentioned are natives of California.

Bartonia aurea usually goes here by the name of Mentzelia Lindleyi. It is found on rocky canyon slopes up to 2000 ft., where large patches of the deep yellow flowers with glistening petals and numerous stamens catch and reflect the hot sun of summer. The biennial M. laevicaulis blooms in the dry summer beds of winter streams as high up as 5000 ft. It has shiny white stems and enormous light silvery-yellow flowers with many long stamens.

Clarkia elegans, in favourably damp locations, grows to the height of 6 feet, and and is one of the most common spring and early summer wild flowers of the valleys and hillsides. The flowers of C. concinna are larger and more striking than those of C. elegans, having feathery petals of bright rose-pink and scarlet sepals.

Eschscholtzia can be found in bloom at almost any time of year, though it is now much less of a " weed " than formerly. Before the real estate man and his devastating tractor became so active in turning under the wild flowers, the foothills of the Southern Californian mountains used to glow for miles when the " Californian Poppy " blooms opened in response to the sun's rays. It is said that by this gleaming mass the mariner at sea, twenty-five miles away, could steer his course.

Godetia Bottæ, " Farewell to Spring," is perhaps the most common of the eighteen native Godetias and their many varieties. This lovely species covers large areas of the hill and chaparral slopes with its graceful cups of white centred Lavender-pink blooms.

The Leptosiphon of the English gardens is similar to Linanthes Parviflorus, an abundant species covering the open ground in the hill country. The Linanthus, Gilia, and like tribes are very numerous and, some of them, very lovely. They should be better known.

Leptosyne Stillmanii (Coreopsis Stillmanii), L. Douglasii and L. Bigelovii are all beautiful yellow Daisies from the hot valleys and desert flats.

The decidedly yellow and white flowered form of Limnanthes Douglasii (Floerkea Douglasii) met with in English gardens, differs in leaf and colour, from the L. Douglasii, native to California, going by that name. The latter has fern-like foliage and white flowers of ten tinged with pink or yellow. It is found in sunny places, in or near shallow water.

Linaria canadensis is a slender plant with delicate Lavender-blue flowers, often covering stretches of sandy soil in masses and giving the effect of waves of rich deep blue.

Most of the annual Linums are yellow and grow on open hill or mountain slopes.

Daffodil Cervantes

Phacelia minor campanularia deserves all the praise given to it by Mr. Warner. It grows on dry high mesas and desert ranges, up to an altitude of 4,000 feet P. viscida is often found in the same intense blue shade, but with a white centre. There are seventy-five Phacelias and a great many varieties, and they form a large part of the spring flower display. Lovely as these native flowers of California are in detail, they are not at their best unless seen growing in masses in their native haunts. " Civilization " is rapidly robbing us of the wild flower gardens that spread themselves over valley and hillside, but there are still places where, if rains have been abundant, miles upon miles of these glorious blooms go to make up a never to be forgotten picture.

LESTER ROWNTREE.

Carmel, California.

Truthful catalogues

On a minor point of this interesting correspondence I would like to join issue with " J. R. K." in his letter printed on February 16th.

It is there stated that " Where the catalogue fails is in hesitating to describe the secrets of culture necessary to perfection in all those plants which require anything
the ordinary."

Apart from the fact that growers d
always know the exact reasons for the
ing successful with an individual plant
that nurserymen grow some of their
difficult plants under the artificial cond
of pot culture, surely Farrer, as a nu
man as well as a writer, hits the nail
head, when on the first page of the intr
tion he says that " The English
Garden " owes its existence, first of
my own craving for guidance across th
charted seas of catalogues. But these
logues, by the very conditions of their
are succinct advertisements rather than
ful guides. Their purpose is not so
to assist as to allure; they cannot, *fo*
sideration of space, be produced on a
which would make them valuable docu
for the cultivator." (The italics are

The catalogues of some of the finest
in the country give practically no c
notes. Why should they? Any gar
with successful culture at heart wou
to the best authority available before
ing a species suspected of having s
requirements, instead of relying on the
sarily desiccated instructions of a catal
for the notes contained therein can be
leading, as is illustrated by some exa
given below, selected from recent pu
tions. Primulas are a family with whi
amateur often needs help, but after re
the following, one may indeed exc
" What is truth? "

Primula minima: " Will not gro
a moraine." " Perfectly easy in culti
in the moraine." " In loose mixtur
peat, leaf-mould, loam and lime and
of sand and chips it will grow and spr
(No risk taken here.)

Primula Clusiana: " Fibrous loam an
in a cool position." " So long as th
does not get too dry it will stand a
unlimited sunshine." " Does best amo
rocks in partial shade in soil conta
lime."

Primula frondosa: " Plenty of moist
essential." " Will succeed in almos
soil and under any conditions so long
is not water-logged in the winter." "
freely in any light soil in any open p
" Fairly dry and sunny position."

Everything considered, personally I th
is preferable for catalogues to refrain
launching out into cultural directio
individual plants; but where, however,
publications, and more especially tho
voted to Alpine plants, might assi
amateur, without any undue addition
pense in space or printing, is by the
sion of a short prefatory note on cult
Alpines in general, with special reg
the more difficult species.

More and still more should it be
what an important part, for instance
drainage plays, and how easy a scree
construct and to grow the higher A
happily in.

It is to the mutual benefit of the n
man and his public for the latter to re
few great principles in the growi
Alpines, and then, these having
mastered, considerable latitude m
allowed in the hundred and one fac
fancies which we all treasure.

F. H. FIS

—— It is only natural that those

TWO SEPTEMBER-FLOWERING SHRUBS

Left : The Silver Sage (Perowskia atriplicifolia), with tall grey stems, grey-green leaves, and purple woolly flowers. The plant has a strong Sage-like scent.

Right : Bursaria spinosa, an uncommon shrub with small cream-white flowers in panicles ; very free and effective.

f a nurseryman to make his garden a payng concern, and to that end he must expend noney on skilled labour and on materials uch as the ordinary amateur, in the majority f cases, cannot afford. There are, of course, cores of gardens in Britain where plants can e grown to perfection, and on account of the xcellence of their staff and conditions of soil, tc., they find no difficulty in reproducing or ven excelling the best efforts of nurserymen. ut without these conditions we "in the alleys" must not expect to make more than distant approach to perfection.

I have never found nurserymen averse to elping us amateurs to the best of their ability ith hints on growing the more difficult subects, or of bringing the easier ones to a igher state of perfection, but I cannot help aying that I have too often found them ready o describe plants as being of easy culture, r especially as hardy, when, in my garden t least, the very reverse is the case. In all robability, on account of the conditions obaining in a nursery, which I have already entioned, a nurseryman may find no diffiulty whatever in growing a certain plant, ut it must not be assumed that it will be asy everywhere.

I have also sometimes found, in the abence of the owner, that the representative in harge of an exhibit has little or no knowedge of the plants shown beyond their names, nd not always that, and I have met most mazing ignorance of the properties or ethods of cultivation of their specimens. he colour question referred to by Messrs. arr is far too difficult a one to discuss here, ut I will just mention one instance. I ought some seeds of Aquilegia glandulosa from a well-known firm which produced flowers of a somewhat displeasing shade of purple and white. I protested that I did not believe it was A. glandulosa at all, but was assured that they came from an irreproachable source. I see the same firm advertising these seeds as a "charming study in Wedgwood blue and white." It is also well known that in many species there are good and bad forms or strains which may not have received distinctive names, and that both grow together in a nursery. It is not surprising, therefore, that one receives a poor form instead of the better one. It always surprises me that dealers do not "rogue" these out when they are in flower. I do not wish to imply that an inferior form is purposely sent out. It is doubtless the fault of some labourer, or that the plant is dug up when not in flower, so that its inferiority is not then apparent.

In conclusion, it is only fair to say that there are nurserymen who make a special effort to describe their plants, and how to grow them, in terms which preclude the accusation of exaggeration, but I fear they form a minority. A. H. WOLLEY-DOD.

Perowskia atriplicifolia

IN the issue of GARDENING ILLUSTRATED for November 3rd, page 703, your correspondent, "G. J.," writing on this halfshrubby Labiate, gives it the generic name of Peroffskya. As a matter of interest, I should be glad to know if this name is correct, as I have been unable to find it in any of the works that I have at hand at the moment. I do not, however, dispute the accuracy of the name, but it is always interesting to know the correct nomenclature of plant names.

Perowskia atriplicifolia is an uncommon shrub with white tomentose branches and fragrant grey-green foliage. It also goes under the common name of "Silver Sage." The photograph reproduced in the abovementioned issue depicts the habit and growth of the plant extremely well. It is very effective planted in groups of several plants together. J. L.

[Perowskia atriplicifolia is fully described in Bean's "Trees and Shrubs Hardy in the British Isles," a book that should be at the elbow of everyone who is interested in the subject. This is, without doubt, the correct spelling of the generic name. It is easy to see how the incorrect spelling Peroffskya came about, as it is commonly known that the combination of letters *ow* in a proper name is, in Russian and allied languages, pronounced *off*.]

Alpine flowers at Wisley

Thirty-five years ago I spent two winters in the High Alps, and in the early spring, when the snow began to melt in patches on the south slopes and ravines, I learnt to admire the Crocus, Soldanella, Primula (probably farinosa), Erica carnea, and Gentians.

Years later the memory of these flowers and the ownership of a tiny garden made me lean towards growing smaller plants for economy of space, and as my gardening knowledge grew I began to discriminate a little as to what was worth growing. We seldom get time to visit the gardens at Wisley, but early last spring were much struck with a noticeable Saxifraga oppositifolia and Anemone pulsatilla Mrs. Van der Elst, which were outstanding features that day. We cannot all be Wards or Farrers, but it is a mild excitement at home to try and discover and acquire plants we have seen or heard of.

I shall not forget the striking salmon-pink mass of flowers of the Anemone in the Wisley rock garden, and wish that from time to time we might have a note of exceptional plants that would be worth a visit to the gardens to see. A. S. L.

Dorking.

Rock gardens at Chelsea Show

With reference to the correspondence on this subject, the announcement made by the Council of the Royal Horticultural Society in their "Notices and Arrangements for 1929" is to the point. After stating that the Council has expressed the desire that a freer use of other stones than mountain limestone should be made, it is stated that "It is believed that many who would like to construct a rock garden are deterred from doing so by the high, though perhaps reasonable, quotations for gardens built of Westmorland or Cheddar stone." I think this is surely a justification of the Council's attitude which should carry conviction that the move is in the right direction. SANDSTONE.

Border Chrysanthemum Mrs. Q. MacFadyen

Since the publication of an article on the selecting of outdoor Chrysanthemums (March 2nd issue), in which reference was made to the views of several prominent raisers, I have received an unavoidably delayed letter from Glasgow.

Mr. Alexander McAlpine has forwarded a photograph and full particulars of the above-named variety which he considers is the best hardy seedling that has been raised in the Braidfauld Nurseries at Tollcross.

A form of the early-flowering Narcissus Tazetta collected in the hills of Portugal

A white double-flowered Cherry (Prunus Cerasus Rhexii fl.-pl.)

Riviera Jottings

Damage by frost

By E. H. WOODALL

THIS severe winter has visited the Riviera in a cruel manner. The old year (1928) went out in a blaze of sunshine. The new year came in with storm and sleet, and roughly speaking there was frost more or less each night during January, and up to February 10th with bright and sunny days. The gardens and tender plants stood this persistent cold very well, and the scarlet flowering Aloes and the Callas were beginning to flower when on Tuesday, February 12th, snow began to fall, and continued to do so more or less for three days. This dust-like snow covered everything to a depth of at least a foot, breaking down shrubs and trees by its weight; during this steady fall the thermometer stood at 24 degrees in the most sheltered places for *several days*. This penetrated coverings and even frames, so that the damage done to the cultivateurs is enormous. Mimosas, so hardy on this coast, have been destroyed either by weight of snow or severity of cold, so that all the battles of flowers have been abandoned or postponed; and it is proposed to raise a sum of money for the relief of the many sufferers who find their Carnations and early vegetables all ruined. One effect of the cold has been to starve the birds, and they have attacked the flowering buds of the Almond trees to such an extent that little or no Almond blossom is to be seen even on March 1st when, in ordinary season, it would be about over, and the pink Peach trees in beauty.

I see Galanthus Byzantinus mentioned as being a very vigorous and desirable bulb in England.

Here I got by great luck half-a-dozen bulbs as long ago as 1908, and they have thriven in a remarkable way, increasing by seed as well as by offset. They suffered badly from the great heat and drought last summer, and instead of the first blooms appearing early in November, scarcely any appeared till about Christmas. I had quite made up my mind that nearly all were dead when after this severe frost and cold, a quantity of late flowering bells appeared—a curious res of heat and cold which has affected Cyclam Coum in the same way and delayed growth of all spring flowering bulbs. Pru Mume, the Japanese Apricot, is only j in flower on March 1st, while Pru Blireana is even later in showing flow both a month or six weeks later than usu It should be remarked that Iris stylosa a Narcissus Italicus, the hybrid between Paper White and the yellow Tazzetta, h bloomed most profusely and have refused be affected by the abnormal weather.

La Selva, Brancolar, Nice.

Transplanting herbaceous plan

At this time of the year, when growth dormant, and work not so pressing as at ot periods of the year, an effort should be m to get herbaceous plants lifted, divided, replanted on fresh ground; or in some ca where they succeed best if divided in spri the ground should be well manured and de ly cultivated. Herbaceous plants are gr feeders, and their flowering season is gre prolonged by having a good depth of lo soil for the roots to revel in. In the mi herbaceous border of the old type strongest rooting subjects soon got mastery of their weaker neighbours, an cut-flowers in quantity are the object which they are grown it will be much better plan to grow each kind in a bed itself, so that each may receive the spe attention it needs.

Herbaceous borders

It will soon be possible to detect vacancies which may have occurred du the winter, and these should be made g with reserve plants from the nursery. done, fork over the surface lightly, care be taken with late-moving plants, such Thalictrum dipterocarpum, Gypsoph Platycodons, and similar subjects, the cro of which may easily be ruined for the wh season if trampled upon.

Bulbophyllums and their Allies

(*Concluded from page 148*)

One of the distinguishing features of the Order Orchidaceæ is that in all species the third petal, the lip (labellum), is more or less specialised to attract and guide some particular insect species to fertilise the flower, in many cases such specialisation preventing the entrance of less favoured insects, though to them the flower may have attractions.

IRRHOPETALUM, a third species in this genus, represents the culminating point. C. Rothschildianum, from Dar- eling, is larger and finer than Colletti. The eudo-bulbs are distanced on a creeping izome and bear a stout, leathery leaf. The ower-scape is 6 to 9 inches high and the owers have their lower sepals, often 6 inches ng, attenuated and diverging at their tips, llow, heavily diffused, and lined with purple- d. The dorsal sepal is pale yellow lined with d, and the similarly coloured petals are argined with red hairs. The lip is bright imson. Several flowers are borne on a ape. Their size and colouring, apart from e specialised shape, places the plant well vay from the so-called botanical species. It ceived a First-class Certificate in October, 395, when exhibited by the present Lord othschild.

Equalling, if not surpassing, Rothschild- num in beauty, though quite different in eneral appearance, is C. longissimum, a ative of Malaya. It may safely be cited as n example of Nature's concentration of nergy in the production of a specialised ower.

The small pseudo-bulbs are but little more an 1 inch in height and carry a single leaf ardly 6 inches in length. The slender scape scarcely longer, but terminates in two, ur, or more large flowers, the lower sepals f which sometimes attain a length of 12 ches, larger than any other part of the ant. Their size and weight prevent a posi- on common to most Cirrhopetalum flowers. hey must droop, but so the full extent of eir beauty is more readily seen. In colour ey are of a soft pink shaded with buff, with eeper pink lines. An indescribable sheen dds lustre to a colour which, known, would e the desire and despair of any Parisian elle. As though not quite contented with e colour effect of the lower sepals, the rsal is marked with purple and haired on e edges, while the lip is soft yellow.

Unfortunately, the plant is rare in cultiva- on—a pity, as few others combine such at- active colouring and floral size.

Makoyanum, also from Malaya, is, though nall, both free-flowering and pretty. The owers radiate, apparently, from a common entre. In reality, the pedicels are so bent at each blossom maintains its position quidistant from its neighbours. The lower epals are not flattened, but have their edges voluted as to give each pair a horn-like ap- earance. They are about an inch long, ear yellow in colour, and as they extend om a raised hub or centre, of reddish- rown, formed by the dorsal sepals, they are ot unlike the spokes of a wheel before the re has been placed in position. About 12 owers are common to an inflorescence.

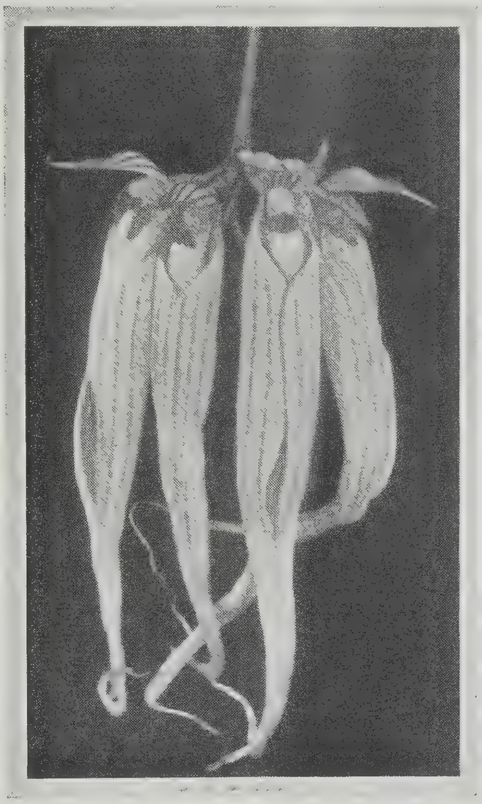
Gracillimum, again from Malaya, is de- erving of its name. The crimson-red colour f the flowers renders them conspicuous, linus colour they would hardly be notice- ble as the sepals, though over an inch long, e threadlike, their points "twirling" in arious directions, as though wishful to be dependent one from the other. The purple, hite-tipped lip has a cup, not an orifice, to scillate in, hence, is slightly restricted in its ownward movement.

Miniatum, from Annam, another small- rowing species, equally depends on its lour—a lovely cinnabar-red—for attraction. The lower sepals are over 2 inches long, uniform in colour, and slightly separated at the tips. The whorl is not complete as in Makoyanum, but more resembles that of a half-opened fan.

O'Brienianum is very similar in habit, but the outer portions of the lower sepals are light yellow, contrasting with the red of the remainder and the upper sepal and petals.

There are many other species worthy of mention, but those enumerated will serve, perhaps, to give some idea of the gem-like beauty and quaint, interesting shapes to be found in flowers of this genus.

In Megaclinium, the outstanding species under cultivation is no doubt M. purpureorachis. So far this is the largest in the genus. The flattened rachis, ascending in a spiral, is 2 inches broad by over 12 inches high, dull purplish-red in colour, with flowers large for the genus, but small compared with the rachis, yellowish in the ground colour, but almost obscured with purple-red. The inflorescence lasts a considerable time, as the basal flowers open first. The extraordinary flower-bed seems out of proportion to the flowers it carries and to the plant, but, I think, the explanation is that size is necessary to attract, and were such a large organ flat, damage by wind might occur. To withstand such stress the plant would have to attain greater size, but the spiral shape obviates this, as wind from any direction would meet an edge, not a flat surface. The slopes of the spiral also allow wind to glance off and at the same time enable insects to crawl to the topmost flowers more easily than would a perpendicular ascent.



Cirrhopetalum longissimum from Malaya

Length of lateral sepals over 10 inches

Grown in the collection of J. J. Joicey, Esq., The Hill, Witley (gardener, Mr. McKay)

M. bufo, from Sierra Leone, is similar in habit, but less. The flowers are rather dull in colour, brown-purple spotting on a lighter ground, and their "squat" shape gives them a fancied resemblance to toads, hence the name. The resemblance is heightened by their contrast with the greenish rachis. Maximum and Clarkei are examples of the genus in which the rachis is not spiral, but turns from the peduncle at an abrupt angle. Though interesting to study, the flowers in this genus are not nearly as ornate as those in Cirrhopetalum. All efforts seem to be toward the flower-bearing portion rather than to the flowers themselves.

As regards culture of these genera, the majority of the species are quite amenable. Just as many Alpines appear to have better constitutions, or are more adaptable than some of their larger-growing relations, so with these smaller-growing Orchids.

In spite of their wide distribution many can be grown in the Cattleya-house throughout the year. Others, particularly those from the warmer parts of the East, may require a slightly higher temperature in winter.

Discrimination must be used when watering, and those species with hard bulbs and thick leaves must be rested after growth is finished; but definite laws cannot be laid down. Success comes with these as with other plants, more from an intelligent study of the plants themselves and the conditions in which they are placed than from any particular rules.

E. COOPER.

Rose pruning after the frost

With the past 10 years of open winters Roses at pruning time, in March and April, have been found in full leaf, and sometimes with even flower-buds. All this foliage has been built up from the sap derived from the previous year's growth. The result has been that when pruned away the remaining buds have not had the maximum of sap or derivatives for purposes of growth and development, though in the end growth may have been satisfactory, due to the work of the new leaves, which have met and made up for any deficiency. The present hard and prolonged winter has had a marked effect, and Rose bushes are without any new foliage, but the fat and healthy buds promise an exceptionally fine Rose season for the coming summer. Pruning too early may result in all the buds being cut down with a sharp late frost. Late pruning would certainly avoid this, but all rosarians want some early blooms. The following is a method which has been practised in previous years and has proved satisfactory:—Prune each bush or tree in three periods—early, mid-season, and late. If possible select basal shoots of last year's growth for the earliest pruning and prune them rather long or on the light side. Now, if all goes well and there is no hard late frost to cause injury, there will be plenty of blooms after the third week in June, and, as these go over, then early July will again find the trees or bushes giving good blooms, to be followed by others on the same bushes after mid-July and to the end of that month. Not only will the same trees give three periods of early summer blooms, but mid-summer and autumn blooms will follow the same sequence. Should the earliest-pruned be caught and destroyed by the frost they can be cut back hard and will flower the latest of all.

It is true that at no time will there be a mass of bloom at the same time, but if a bed of one variety is thus pruned it will be in perpetual bloom the whole season, and is certain to yield some remarkable flowers of excellent quality, possibly, in all three seasons—early, mid-season, and late. It is not possible to name a date correctly, as seasons vary, but the first pruning, when the first third of the bush only is pruned, should not be before, say, March 15th, the second third on March 31st, and the last on either April 10th or 15th. These dates may vary a day or two before or after, according to the season. It is essential with this method of pruning that the giving of active fertilisers should commence the moment the first leaves are about two-thirds their normal size, and be followed up regularly afterwards, but until all the leaves are out and functioning only half the usual quantities will be required.

An application of $\frac{1}{3}$ oz. sulphate of iron to 1 gallon of water, making the gallon solution cover 10 square yards to 12 square yards of soil surface directly after the first pruning will enhance the depth and tone of all Rose blooms and should not be omitted.

C. A. Jardine.

Chionodoxa (Glory of the Snow)

The Chionodoxas are very beautiful early spring-flowering bulbs, extremely hardy, and well adapted for growing in positions where they can be left undisturbed, with a view to forming colonies or masses, or for naturalising in grass, the roughest parts of the rock garden, or in semi-wild situations. Once they become established they will increase themselves freely from seed, the subsequent seedlings flowering in their second or third years. They will grow in any ordinary fertile soil, but thrive best in deep loam, and favour a sunny situation. They may also be grown in pots for indoor decoration, but they should become thoroughly rooted before removal inside. Chionodoxa Luciliæ is, perhaps, the most commonly grown of the several species. It commences to open its starry flowers in February, which are an intense blue, shading to white in the centre, produced on slender spikes usually three to six flowered, but sometimes as many as 20 flowers are produced. The plant grows about 6 inches high. There are several forms of this species, viz., alba, a white form, and rosea with pink flowers, as well as one or two others. Chionodoxa gigantea is a plant with a more robust habit than the former, with taller spikes of flowers and broader leaves. The flowers are large, of a delicate pale blue colour. C. Sardensis has rich, deep blue flowers with a white eye, a little smaller in all its parts than C. Luciliæ. Another dwarf species is called nana, a plant about 4 inches high with dense spikes of white or pale lilac flowers. The species are all natives of Asia Minor and Crete.

J. L.

Camellia speciosa in an Irish garden

This early-flowering species from Western China is a plant of distinction and beauty. The flowers are single and saucer-shaped, with five to six petals about 4 inches across, pale apple blossom-pink inside, rose-pink outside. The filaments are a pale yellow colour, the anthers a golden shade. The buds are pointed, in groups of two; the contrast between the deep pink point shading to pale green at the base is beautiful. The calyx is a deeper green. The leaves are ovate-lanceolate acuminate, somewhat like those of Camellia Sasanqua, and 2 inches long by $\frac{3}{4}$ inch in a young plant. They are dark green above, light, polished green beneath, finely serrated over the entire margins. This plant was noted in flower, growing on a wall at Headfort Kells, Co. Meath, during the second week in February, following a night of hard frost. The flowers and buds were uninjured. This most desirable plant does not seem to be in commerce.

Willbrook. Phylis Moore.

Silenes

Varieties for the rcok garden

The value of Silenes or Catchflies in the rock garden is often overlooked, and although a few of them may be classified as difficult plants, their requirements are well worth studying. Among the more easily grown species Silene Schafta is a desirable traili plant with a long flowering period wh commences in summer and continues of into the autumn. The flowers rise w above the foliage and are of a rosy-purpl magenta. It likes a gritty soil with so leaf-mould, and, although a sun-loving pla it is not averse from partial shade. Se sown in the spring will produce plants flower the following year. If Silene Hook can be protected from excessive moist during the winter it is by no means a d cult plant. It prefers a well-drained sa soil containing a liberal amount of le mould and a quantity of lime-rubble, should have a position in full sunshine. flowers are star-shaped, with reflexed pet and the colour is of a pleasing clear pi A few pebbles placed about the plants keep the foliage from sprawling too much the soil. Although some gardeners con this species to the moraine it will do qu well in the rock garden if care is taken. is readily raised from spring-sown seeds.

Some of the varieties of the Moss Camp (Silene acaulis) make very dainty rock pla Mr. Elliott's Six Hills variety is probably best. The introducer brought this plant fr Mont Cenis, and most people admire pretty salmon-rose flowers. S. californic a scarlet-flowered species introduced, I lieve, by Mr. Perry, of Enfield, and it sho become popular when better known. pendula is the well-known spring-flower biennial with rosy-pink or white flow freely disposed over dense-cushioned folia Of this there is a neat form known as c pacta. Seedlings raised in the summer grown on like Wallflowers will pro plants for the following year's display.

H. Greave

Annual climbers for the garde

Although no provision may have b made to cover some unsightly object or fe in the garden with permanent climb there is still ample time to make ame by sowing annual creepers which will as a screen, and contribute beauty in the t of flowering. Ipomæas or Morning Glo

A colony of Chionodoxas (Glory of the Snow) grow rapidly, and give a wealth of blossoms in varying shades of blue and scarlet. Tropæolum canariense yields quantities of soft yellow flowers amid foliage of tenderest green, and soon covers any space required. This is the well-known Canary creeper, and will grow in any sunny place in a garden. Other Tropæolums like fulgens, Lucifer, and Firefly in scarlet and orange are extremely showy. Humulus japonicus (Japanese Hop) is noted for its attractive foliage, and is easily raised from seed sown out of doors in spring. Let the ground these annual creeping plants are to occupy be prepared by digging and incorporating with it a little manure and vegetable refuse, and sow the seed as soon as weather permits and locality warrants. This may be in March or, in cold quarters, in April.

WOODBASTWICK.

Helleborus corsicus

SOME interesting contributions have recently appeared on Hellebores. Mr. Cahen, in his article in your issue of December 15th, 1928, expounds on the merits and delights of Christmas Roses. Mr. Bowles follows later with H. cyclophyllus, proclaiming it "the finest of all those with green flowers," and now my purpose is to sing the praises of another species with green flowers.

H. corsicus (syn. H. argutifolius and trifoliatus) is an upstanding plant with foliage to make it a variety of great merit during the winter months. In my garden I have a plant originally collected in Corsica. Transplanted from one garden to another, it now forms a bush just on 3 feet high and perhaps 2½ feet across. It has 16 stems, each growing from the original root. Each stem has its cluster of 10 to 20 flowering buds arranged in deltoid corymbs. When these open and bloom they are of a pale yellowish-green. The sharp, leathery, prickly leaves and yellow-green flowers characterise the plant a typical H. corsicus.

The beauty of this plant as compared with other varieties is that it retains its foliage during the winter, unimpaired by frost and bad weather, and at the present moment is of a dark bottle-green colour. The new growth of leaves are of a blue or silver-green colour. Although my shrubby bush is, in itself, a good specimen, I have seen a much larger one in Mr. Mark Fenwick's garden at Stow-in-the-Wold. All other varieties of the genus at this time are bedraggled, in many cases lifeless and on the ground.

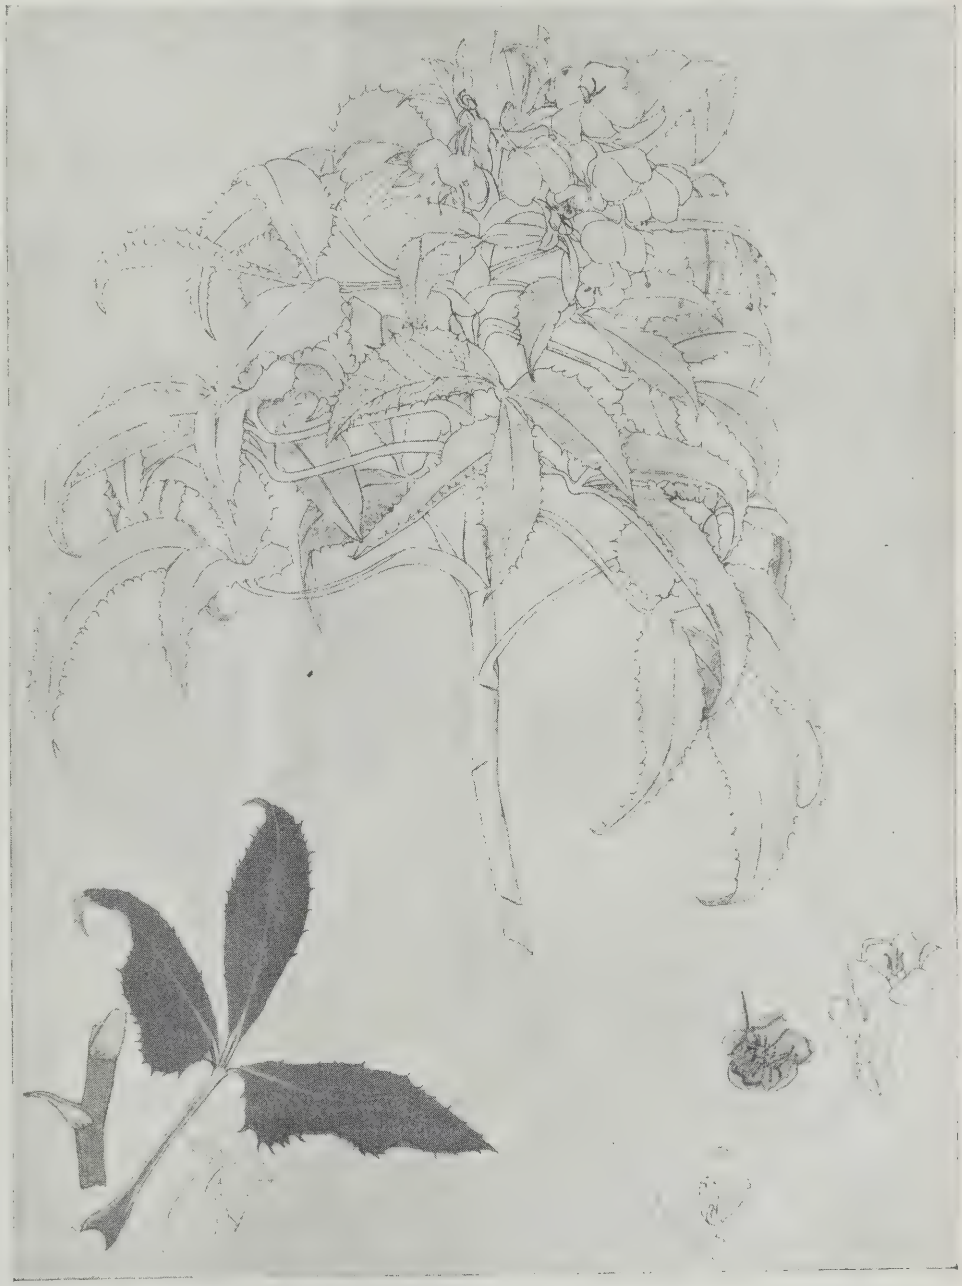
The illustration accompanying these notes represents a cup stem of 24 inches. A very good illustration of the flowers is in Bot. Reg., tab. 54, 1839, and if my memory serves me aright this species was introduced into this country in the 18th century.

G. P. BAKER.

Ramondia pyrenaica

This plant is deserving of cultivation wherever Alpine plants are grown. It is worthy of an important position in a cool and shady situation. Ramondia pyrenaica is a native of the Pyrenees, liking cool positions in clefts and fissures in the mountain gorges, where it is constantly subjected to the spray of the torrent and mountain mist.

Although perfectly hardy, the climate of this country is somewhat trying to the plant, owing to the wet and alternating changes during the winter months. This is chiefly on account of its habit, flat in form, and the general hairy character of its leaves, which tend towards keeping it wet, thus causing it to rot at the collar, the most frequent trouble one has to contend with. This, however, may be overcome very largely by imitating natural conditions, planting in fissures of rockwork or in crevices on the face of a wall. It is not advisable to plant on the flat, but plants will grow very well on the lower part of a wall, where the rooting medium is cool and moist. A situation facing east will generally be found to be the most suitable aspect for this plant, as the shade essential for maintaining cool and moist conditions for its roots will then be ensured. A good medium for growing the plants in is good sandy loam and peat.



Helleborus corsicus
This stem represents a length of 24 inches

The flowers are purple-violet in colour with an orange-yellow centre, about 1 inch across, produced on stems 2 inches to 6 inches high, in spring and early summer. They vary in number from one to several on a stem. The rough leaves are in the form of rosettes close to the ground, hairy on both surfaces, ovate and deeply toothed, the rosettes being from 4 inches to 8 inches across. There is also a white-flowered form of this species. The plants may be increased by means of seed, or division of strong, healthy plants, during the early spring. The plant is, naturally, slow-growing, and seedlings develop very slowly, the latter taking at least two years before they attain to flowering size.

J. L.

Lobelia: Propagating from cuttings

Those who last autumn made a point of keeping a few old plants of Lobelias in pots in the greenhouse will now be in a position to take cuttings from shoots which are now making headway. If taken at a joint and dibbled in pots or pans of coarse silver sand and a little loam, and plunged in the warm bed of a propagator, or kept near the warmth of pipes, in the absence of a propagating pit, they will soon take hold. An effort should be made to prevent the cuttings from flagging by keeping them as near the glass as possible. After two or three weeks the tiny plants can be boxed, or potted off, and from them another lot of cuttings will be forthcoming in a short time. A warm, moist atmosphere and a compost largely made up of sand are all that one needs to work up a nice stock that by May will be ready for planting out of doors.

TOWNSMAN.

Uncommon plants in Greycoat Street

PINUS THUNBERGI

MRS. ANNAN BRYCE, Ilnaculin, Glengariff, Co. Cork, sends to this office a fine cluster of cones of the Japanese Pinus Thunbergi, which was afterwards exhibited at the Royal Horticultural Society's meeting on February 26th in the new hall in Greycoat Street, Westminster.

Pinus Thunbergi occasionally produces an abnormally large number of cones on a single inflorescence.

In 1909 a branch of one of the trees at Kew bore no fewer than 65 cones, but this was exceeded in 1926 by a tree at Hergest Croft, Kington, Herefordshire, which produced 74 cones. The cluster sent had no less than 116 cones. The cluster of cones was later brought before the Scientific Committee.

This Pine is very common in Japan, and is largely planted there for forestry purposes. It is the Pine which appears in the "Willow plate pattern."

LEUCOCORYNE IXIOIDES ODORATA

This beautiful plant, shown by Mr. Lionel de Rothschild, created great interest. It is a bulbous plant requiring greenhouse treatment, and was collected by Mr. Clarence Elliott in his recent expedition in Chile, although first introduced in 1826. The plant resembles a Brodiæa, to which it is closely allied. The flowers, pale mauve, are borne in heads on long, wire-like stems. A most pleasing feature of the flowers is their pleasant Heliotrope scent. The flowers have good, lasting qualities and should prove of great service as cut flowers.

POMADERRIS ELLIPTICA

This tender New Zealand shrub was shown in flower by Messrs. Hillier and Sons, Winchester. It belongs to the Natural Order Rhamnaceæ and has clusters of small cream-yellow flowers, each flower a bunch of yellow anthers.

FRITILLARIA KARADAGHENSIS

A rare species from Northern Persia, shown by Messrs. Wallace and Co., Tunbridge Wells. The flowers are bronze-coloured with similar scent to that of the better-known species, F. pyrenaica.

Many Alpines were shown on this occasion, including fine pans of Saxifragas Faldonside, Burseriana, and Brookside; also Soldanella montana and the little bulbous plants, Muscari azureus, Chionodoxa Luciliæ, and the pale blue squill-like Puschkinia scilloides, illustrated on the page opposite. H. C.

FRUIT GARDEN

Strawberries for forcing

IN forcing Strawberries it is essential that young plants be obtained from strong, healthy parents. To get these it is advisable to plant up a fresh batch of runners each August. The parent plants should be allowed to flower so that barren ones can be picked out and destroyed. Remove these flowers as soon as "roguing" has been attended to. Plants for throwing runners should be given a good position on a border facing south. Plant 1 foot apart in the rows and 2 feet between rows. Each plant will, if well cared for, produce five or six plantlets before the following June. In June layer the runners into 3-inch pots filled with a fairly rich compost, or even little squares of loam will do, but in each case sink them to the brim in the ground. Layer into alternate rows so that a gangway is left for walking. The soil for the final potting into 6-inch pots should be mixed early, say, in July.

A good compost to use is as follows:—Four parts of good loam broken up into pieces the size of a Walnut, one part of old Mushroom-bed, half a part of lime-rubble (where the loam is sandy use chalk). To each barrowful of soil put a 5-inch potful of bone-meal and half that amount of Thomson's Vine Manure. The pots should be well washed and crocked and a little sprinkling of soot put over the drainage to keep out worms.

The rooted runners are severed from the parent plants in July and placed on the north side of a hedge or wall to remain till the final potting. This is done in August, and should be finished by at least the end of the first week. When potting, it is essential that the ball of soil round the root should be moist. Therefore it is advisable to go over the young ones in 3-inch pots and water all that are dry.

Pinus Thunbergi
116 cones in one cluster!
Sent by Mrs. Annan Bryce, Glengariff, Co. Cork

Make sure, also, that the potting soil is in the right degree of moistness. Pot the young plants firmly. When all are potted stand them out, pot-thick, on a level ash yard which has been previously sprinkled with lime and soot mixed so as to ward off slugs. Turn the pots round occasionally to prevent the roots from congregating at one side, as they will often do.

Spray over the plants twice a day on bright days and water them four or five days after potting. If a period of heavy rains sets in, the pots should be placed on their sides. At the end of August space out to the width of a hand between pots and remove all runners and side crowns.

In October begin getting the plants under cover. Cold frames will be found best if free from drip. Avoid such houses as Peach-houses and vineries on account of Red Spider and Thrip in such uncleaned houses at this time of the year.

If early forcing is contemplated it will be wise to give the plants a little start. A very good idea is to fill brick pits with a mixture of leaves and a little stable manure. Tread
firmly and plunge the pots in it up to
brim. Leave the top open to full air.
there will be a gentle heat given off by

canes should be well thinned and neatly
as growth advances, cutting away all su
fluous growths. Like the summer-fruit
varieties, they like generous treatment in
way of solid and liquid manures, and
higher the feeding within reason the finer
fruit. After fruiting, the canes should be
down level with the ground, as it is on
young canes made in the current year that
fruit is borne. In this particular only
the treatment differ from that accorded to
summer fruiters. W

Border Chrysanthemums

Continue to secure cuttings of these as
shoots become ready until sufficient stock
been obtained. These will root quite rea
now in a cool greenhouse, pit, or even i
cold frame. Earlier batches as they bec
well rooted should be moved to a cold fr
and kept close for a day or two; air sh
then be gradually admitted so as to keep
young plants sturdy and hardy.

FLOWERS SEEN AT THE ROYAL HORTICULTURAL SOCIETY'S MEETING ON FEB. 26th

1. Leucocoryne ixioides odorata, a greenhouse bulb with pale mauve flowers and the fragrance of Heliotrope.
2. Soldanella montana, the daintiest of high Alpines.
3. The double flowered Almond Clara Meyer, flowers deep rosy pink.
4. The pale blue Squill-like Puschkinia scilloides.
5. Pomaderris elliptica, a tender New Zealand shrub.
6. A fine pan of Saxifraga Faldonside.

REMINDERS FOR THE WEEK

Southern and Midland

Apricots and Peaches

Material should be placed in readiness for the protection of the flowers. Nets suspended from the glass lights or wall coping will need to be three deep, or canvas and tiffany may be used, providing such can be rolled up during favourable weather. Short branches of Yew, Cypress, or a similar evergreen are sometimes used effectively by placing these among the flowering growths. Light blinds which can be rolled up during the day are undoubtedly the most satisfactory, but it often happens that more humble methods, such as the use of evergreen twigs, have to answer, and, when such is adopted, allowance must be made for light and air to reach the flowers.

Fruit in store

Apples are keeping very well, but it is important that specimens showing the least sign of decay be removed immediately. Sufficient air to keep the rooms fresh and sweet should be permitted. This must not, however, be overdone, otherwise conditions will become too dry and the fruit shrivel. A little moisture assists in the keeping of Apples by maintaining them in a fresh, plump condition.

Shrubs to prune now

These include Buddleias, Ceanothus, and Chimonanthus fragrans where its flowering is over, winter-blooming Honeysuckles, Jasminum nudiflorum, Cornus alba, Salix britzensis, and Berberis japonica, and B. jap. var. Bealei. The last-named kinds do remarkably well when planted beneath a canopy of light foliage trees, and when in a healthy condition these may be kept dwarf and vigorous by what many would term severe pruning. These fine evergreens have produced a beautiful display of bloom with me this year.

Pruning climbing plants

This should by now have been completed, as the buds are moving fast, and those growths which were reserved for layering purposes must now be dealt with. I find the most convenient method to be that of sinking pots filled with sandy soil into the borders up to their rims, and bringing the long growths down, and securing them to the pots with a stout wire pin, this being run down through the hole in the bottom of each pot. When these pots are filled with roots—usually in October—the layers may be severed and the plant transferred complete to any desirable site.

Open ground among newly planted shrubs

Such spots may be utilised for Michaelmas Daisies, and one might, with advantage, secure a few of the more recent introductions when such positions are available. Failing this, it is advisable to divide up existing varieties frequently and transfer them to fresh soil, where, planted at a distance of from 4 feet to 5 feet apart, they form handsome specimens.

Potato sets

It is advisable to stand these edgewise in boxes in order that the eyes may become green and strong—all possible seed should be treated in this way—but not everyone possesses sufficient room in frost-proof structures to enable them to carry this out, and to such I would advise the use of a cold frame which can be safely protected from frost by generous covering.

Early Potatoes

A few rows of May Queen, Webb's Express, or Witch Hill Early may be planted on a warm and well-drained border, but avoid large plantings for the present. The rows should be 2 feet apart and 1 foot between the sets.

Asparagus beds

These should now be lightly forked over and the alleys shaped and cleaned, after which a light dressing of agricultural salt may be given. Further batches of roots should be introduced to the forcing-house, as the earlier-forced roots show signs of exhaustion. Roots for this purpose are usually grown on the flat and are liberally fed.

Winter-flowering Begonias

A few cuttings are now available, and no time should be lost in getting them inserted in sandy soil in the propagating frame. Where extra large specimens are desirable a few of the cleanest and healthiest of the old plants may be shaken out and potted into fresh soil.

Gloxinias

After potting into fresh soil place further batches in gentle heat. This also applies to Hippeastrums. E. Markham.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Brussels Sprouts in late districts

In many of our later districts no reliance can be placed on outdoor-raised plants of this popular winter vegetable, because, unless the season is an exceptionally fine one, they have no time to mature, and it is only waste of time and ground to attempt to grow them. Even by sowing in autumn there is always the risk that these either get damaged in a hard winter or else "bolt" during summer. To avoid disappointment the best plan is to sow now in boxes and set in a gentle warmth, the seedlings, when fit to handle, being pricked into a bed of sweet compost under a cold frame. In this way fine plants are fit for their permanent quarters during May.

Maincrop Brassicas

If not yet sown, the very first opportunity must be seized to get in full sowings of Cabbage, Cauliflower, Savoy, Curled Greens, Russian Kale, and autumn Broccoli. Select a sunny border where the soil is not unduly rich. Shallow drills 12 inches apart are best, and the seeds should be scattered evenly and rather thinly, first coating with red lead to prevent the birds devouring them.

Maincrop Leeks

These, too, should be sown at the very first chance. The soil need not be very rich, as this crop has to be transplanted later, and then a very rich site can be provided.

Onions

Unless these can be got in now there is really little use in attempting to cultivate this crop by sowing out of doors in spring. While "Onion sets" seldom produce a really good crop, they are, at the same time, very suitable for early use, being large enough for flavouring purposes long before even the autumn-sown batch is ready.

Sprouting Potatoes

Even Maincrop and late varieties are better for being "sprouted" before being planted, so it is now time to have these boxed and set in a light place so that they may undergo this process. Under the stages of a c greenhouse is an excellent spot for the p pose, but the boxes must not be near h water pipes. Any light position, however, not too warm and safe from frost, will equally well.

Beans and Peas

At time of writing, the whole country lying under snow and ice, so it is more th likely that in many gardens even the fi sowing of these has yet to be got in. Unc present conditions this is just as well, even the best seeds cannot be too comfo able lying under this cold carpet. Clima conditions, however, change so suddenly th by the time this is printed a favourable sp may have set in, so, if it has, get these t important crops sown without delay.

Rose planting

Although I have planted Roses quite su cessfully as late as March 15th it is very u desirable to defer such important work un that date, so if at all possible get any arrea wiped off at once. Prune the bushes befo planting or immediately afterwards.

New herbaceous borders

Even on heavy soils, should the weather fine and the ground in working order, a necessary planting of perennials should nc be carried out. Where at all possible sel a fresh site for such borders, and apply a f dressing of well-rotted manure or we decayed garden refuse, double-digging trenching some little time in advance, so th it may be nicely settled down. If it has be necessary to delay preparation of the bord until now it will be advisable to tread t whole down before starting to plant. Do n plant while the soil is wet, or much har will result.

Increasing Dahlias

This is done in three ways—by seed, division, and by cuttings. If sown at on in a fairly brisk heat seeds may be employe while, by dividing the old stools shortly aft they start into growth, good plants a secured, every shoot having a tuber attache being suitable for the purpose. Place pots just large enough to comfortably ho the roots. Where a large number of vari ties true to colour are required cuttings a the only satisfactory method by which th can be accomplished. Secure sturdy (not u duly stout) shoots from 3 inches to 4 inch long, endeavouring to get a "heel" wi each cutting. Insert firmly in pots filled wi sandy compost, and plunge in a gentle h bed or propagating case. Though, naturall they take longer, the cuttings will eventua root standing on a moist bottom in a war house or pit.

Streptocarpus

The modern types of this plant are, trul among the very best of our greenhou plants, few others blooming over such a lo period. If seeds were sown in January t seedlings should now be fit for pricking o In their earlier stages they are almost delicate as are Begonias, and similar tre ment will suit both until ready for potti off.

Late-flowering Chrysanthemums

As the later cuttings become well root have them potted off singly into $3\frac{1}{2}$-inch 4-inch pots of good, fresh compost. Retu to same temperature for a week or two b fore moving to a cold frame. Earlier batch should now be in the frames, this pla thriving best under cool treatment.

C. Blair.

Preston House Gardens, Linlithgow.

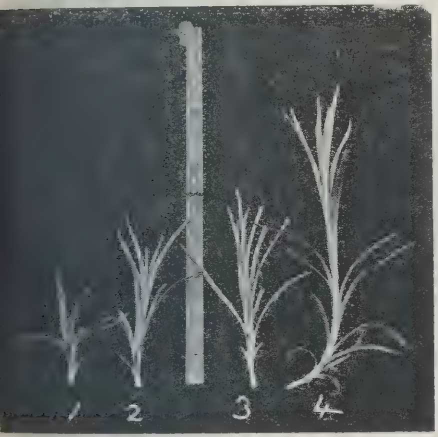
Perpetual Carnations

THERE was comment recently in Covent Garden Market on the scarcity of good Carnations, but this is a normal state of fairs during such weather; yet, like the eather itself when seasonable, it is not ways taken as a matter of course.

The past winter—or at least, happily, arly past—has not been abnormally sunss, but what sun we have had has been insfficient for most winter-blooming plants. ne Carnation being a sun-loving plant turally opens slowly under such conditions, d if the trade growers who cultivate wers for their living find them short there little wonder that the amateur grower is fected in the same way.

It is not good policy to try and force Carntions, and far better to let Nature have r way by allowing the plants to grow at eir own pace in a temperature not much ceeding 50 degs., with ventilators open a tle in normal weather. During exceptional eriods, such as continued through the exssive cold of February 10th to 17th, temerature must, of course, drop, and it is likely at the majority of Carnation-houses stood low as 40 degs. at this time.

Despite outward appearances, however, we re on the threshold of the most busy season f the year. The immediate work to be aken in hand, if not already completed, is he mixing of compost to pot off young plants nd rooted cuttings. This should be mixed vell in advance of the time required, for it is bviously not good policy to take cold soil rom outside, as the tender young roots will ot take kindly to such. The best method s to bring the compost under glass and allow he sun to warm it at this time of year. The ompost should never be wet when used, or, ndeed, moist enough to adhere to the fingers.



Good and bad types of cuttings

2 and 3 are good; 1 and 4 are unsuitable and bad

To pot rooted cuttings a good compost is oam chopped fine two-thirds proportion of he whole, equal proportions of leaf-soil and and one-third, with a 7-inch or 8-inch potful f wood-ash or burnt bonfire refuse added to he barrowload of soil. This gives a light nd open compost suitable for the rooted cuttings. This first potting behoves one to take are to see that the cuttings are not potted leeply, rather less than ½ inch being suffiient. As I have mentioned before, deep otting is fruitful of stem-rot, and is often he origin of it.

Whether one uses a 2-inch or a 3-inch pot or the rooted cuttings is of little importance, xcept that until the middle of March they ecome established more quickly in the 2-inch ot, and after the end of March the 3-inch pot is a little more permanent and satisfactory than the smaller size.

Care should be taken to see that sun does not shine directly on recently potted cuttings. Sheets of paper spread over them are useful for this purpose.

CUTTINGS. — Succeeding generations of Carnation growers are always puzzled as to the best time of year to take their cuttings. Many old gardeners prefer the autumn-struck one, but the resulting young plant needs such care and so light and airy a position in the house that I always think the March-rooted cutting is the amateur's best friend. He can usually select better cuttings at this date which root more quickly and may be grown without a check with greater facility. It is the quickly grown plant which scores in the end and is less likely to go hard. Now, then, is therefore the time to get busy to put cuttings in, and the pure, clean sand is the best medium in which to root them.

Side shoots show freely on healthy plants in March—unhealthy plants should not be propagated from—and these, after being put into the sand, should be watered in. A good method for the amateur is to half-fill a pot with crocks, then complete with sand. The cuttings are dibbed in ½ inch apart and made firm. Placed in a clean propagating frame with a bottom warmth of about 60 degs. they root in about three weeks. If shaded (as is necessary) they require little water during this period. When rooted they should be removed from the propagating frame for a few days to harden off ere they are potted as above.

The March duties of the Carnation grower are among his keenest pleasures, for he realises that winter has at last gone, and it is a pleasure reserved for the practical worker in a practical way. LAURENCE J. COOK.

Bush Hill Park.

VEGETABLES

Celeriac

THE amateur seldom gives this serviceable vegetable consideration when selecting his seeds for spring sowing.

It is somewhat strange that this should be so, because it involves less trouble in its culture than Celery itself, and forms an acceptable dish when cooked, or even used in salad. It seems to be left to gardeners on the Continent to grow it in anything like quantity. Known also as the Turnip-rooted Celery, it is in prime condition from October until about April, and should be left in the soil and lifted as required, as—like Parsnips—the flavour improves more thus, than when it is stored. In cold heavy soils, however, it is sometimes necessary to get the roots up in autumn, otherwise they rot away. To have the best from Celeriac, a long season of growth is necessary, and in its early stages it should be treated precisely like Celery by sowing seed in pans or boxes of light soil in gentle heat, pricking off the plants when ready, and after hardening off, planting out of doors in May or at the latest, in June.

While it is acknowledged that to grow good Celery one ought to be prepared with trenches well manured, and the subsequent earthing up of the plants, Celeriac needs no such preparation, as although the soil needs to be light and rich, there is no occasion to go to the trouble of digging out a trench.

To plant on the level is the rule, and if ground is dug over and in it is incorporated light sandy compost, *e.g.*, old potting material to lighten it if heavy, and a little old manure dug in, this will go a long way towards ensuring a good crop. Work of this character is best performed in the late autumn or winter. Before planting Celeriac out in their final quarters, the bed must be raked and levelled and made quite firm, and in choosing the aspect for the bed, preference ought to be given to one in a south position.

In one respect the after culture of Celeriac is similar to that of Celery, in that it requires an abundance of water in a dry season, and to the uninitiated it may be observed that the edible portions are the "chumps," or axis of the plants, which are used for cooking. These are delicious when stewed and served with white sauce.

London or Rosette Colewort

Although by no means a novelty, this valuable Cabbage is far from being as well known as it deserves to be. The market gardeners around London plant great quantities. Plenty of private gardeners at the present time would be glad of a breadth of Coleworts to cut from, and it is quite certain there is nothing to surpass them in the way of greens. The seed should be sown not later than the end of May, and the plants put out whenever there are any vacant plots ready for them. They may be disposed about 12 inches apart each way, and, provided the ground is good, all will form neat and serviceable heads. Hill's Dwarf Incomparable Cabbage requires but little more room than a Colewort, and this, too, may well be given a trial.

Yellow Tomatoes

It is said that "demand creates supply" and in the case of yellow Tomatoes there is little demand. Why this should be has always been a puzzle, as they are quite as easy to grow as red, and, in my judgment, more acceptable in salads, being of a more "fruity" nature. Last year I sent from my own raising samples to friends who grow the red varieties exclusively, and who expressed their satisfaction after having them with other salads. Possibly my action secured converts, for several intend to grow them another year. One of the best of the yellows is Golden Queen, an old sort that is worthy of being largely grown by those who are open for a change. Sunbeam too is an ideal yellow variety. If seed is sown in the warmth of a greenhouse in February, other things satisfactory, plants will crop by July—as mine did last season. W. F.

Export of Cornish Broccoli

Until about three years ago the Broccoli produced in Cornwall was grown from local seed, and a large proportion did not produce the firm white curds which distinguish the best types. During the last few years, however, a considerable amount of seed of superior strains of Broccoli has been obtained on the suggestion and through the agency of the Ministry of Agriculture and Fisheries. Cornish Broccoli of these superior strains is now equal to the best, and is, therefore, likely to find a satisfactory market in Germany and Belgium. The Cornwall County Education Authority, the Cornwall Branch of the National Farmers' Union and the Ministry of Agriculture and Fisheries, acting in collaboration, have drawn up a scheme for applying the National Mark (the same mark as is being used for home-produced eggs) to export consignments and for ensuring that only the best shall carry it. Regulations in regard to grading have been issued under the Agricultural Produce (Grading and Marking) Act, 1928, and National Mark labels in French and German have been designed and issued. It is not known to what extent the growers will find it remunerative to export, but they will certainly test the possibilities. This interesting and enterprising experiment in marketing will be watched with interest throughout the country.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

GREENHOUSE

Potting Azaleas and Cyclamens

When is the best time for potting into fresh soil Azaleas and corms of Cyclamen to carry on through the summer in a cold house and induce growth for flowering indoors next season? Should Cyclamen ever be allowed to dry off, and is bone-meal suitable for mixing with rather poor earth when repotting?

(Miss) F. Mordaunt.

[Azaleas, when they require repotting, should have this attention, after blooming, while corms of Cyclamen should be potted in July. It is best to gradually dry these off, a good plan being to place the pots on an ash bottom, at the north side of a wall, and as soon as the leaves begin to turn yellow, to turn them on their sides, which prevents rain wetting the soil. As soon as the leaves are thoroughly ripened the repotting may be carried out.]

Primula stellata

(L. S. O.).—We have made a microscopic examination of your specimen and have ascertained that the spotting is due to an attack of a piercing mouthed insect, probably Aphis or White Fly. We can get no further than this because we failed to find any of the culprits. If they were on the leaf when it left you they must have escaped in the post. Have a look over your plants and try and discover the pest. If you fail send us several leaves packed in an air-tight tin or small glass tube. If we can find out the pest we should be in a position to advise you as to control measures.

Primula obconica

(F. A. W.).—The Heliotrope sent for examination is affected with Botrytis, and it seems to us more than likely that the trouble with your Primula obconica arises from the Heliotrope. Go over the Heliotrope carefully and remove all dead growth and keep the foliage dusted with Flowers of Sulphur for a time. If this or similar treatment was carried out it should clear the Heliotrope of the Botrytis. It appears from your remark about the slime on the pots that perhaps the ventilation of the house is not too good. The air should circulate through the house so that the damper portions are dried out better. We maintain that under good conditions Botrytis should not be really troublesome, but there seems to be no reasonable doubt that the fungus lives on the Heliotrope all the year round and attacks the Primulas in season.

Cyclamen diseased

(W. G. P.).—Your Cyclamen are too badly affected with disease to be worth keeping for another year. You should either raise from seed or purchase a batch of seedlings for next year and grow them under cooler conditions.

Lachenalias for examination

(F. W., Kent).—The bulbs have been carefully examined. In every instance the roots are poorly developed. In one of the largest bulbs various fungi have found a way in and set up decay, and in some of the others the basal plate appears to be attacked by a fungus, but there is no clear evidence that the fungus was the first cause of the trouble. Everything points to some fault in the cultivation rather than to the attack of any particular disease.

FLOWER GARDEN

Plants required

I am very desirous of obtaining a plant of each of the following. They do not appear to be in commerce, but I think it possible some of your readers may possess them and be willing to exchange or sell:—Dracocephalum grandiflorum, Arenaria Gothica, A. parnassica, Felicia rotundifolia, Dianthus striatiflorus, Ruscus hermaphroditus, Veronica Coxii.

T. L.

12, Morden Road,
Stechford, Birmingham.

[Dracocephalum grandiflorum is offered by Mons. H. Correvon, Floraire, Chenebourg, Geneva, Switzerland, at 2 franc 50. Ruscus hermaphroditus, we believe, is not in the trade, and the only owner of it we know is Mr. E. A. Bowles, of Myddelton House, Enfield. We do not know if he would entertain an exchange. Veronica Coxii does not appear in any reference book on the genus, not even in the New Zealand ones; the nearest we find are V. Cookiana and V. Cockayniana. Messrs. Ingwersen, of Birch Farm, Sharpthorne, East Grinstead, can supply both Arenaria gothica and A. parnassica, and list the latter under the synonym of Alsine parnassica. Dianthus striatiflorus is a hybrid of D. barbatus, near D. Atkinsonii, but with plain pink flowers and the same bad constitution, and is not, we think, obtainable at present. The right name for Felicia rotundifolia is Agathea rotundifolia, and under that name you can easily procure seeds of it from any of the big seed firms, though it is possible that they list it as Agathea cœlestis.]

Types of Dahlias

("Ban Na Pol").—A Cactus Dahlia is quite double, the petals being long and narrow, sometimes incurved, but as often quite straight, while a Decorative has broad petals of no particular form, the fact being that "decorative" has no defined meaning when applied to the Dahlia. In this class are many huge flowers and also many rather small and dainty. A Pæony Dahlia differs from a decorative, chiefly because it is semi-double only, but the petals are also nearly flat and somewhat uneven in length and form.

Border flowers

I have an old Yew hedge about 7 feet high and 30 yards long by the side of a tennis lawn facing S.E. Between it and the grass there is a border about 1 yard wide. The soil is good, but it is difficult to grow anything satisfactorily there. There is a ro
Grape Hyacinths that does well, but I
some flower that would grow alongside
Yew and would give a good colour in
summer after the Grape Hyacinths
finished.

E. A. O. Traver

[It is not every plant that will thriv
such a position, but if the soil be well
and a little well-rotted manure worked
it some of the dwarf Dahlias—Coltness
and its hybrids—should bloom all r
Then the intermediate Antirrhinums o
to do quite well. Early-flowering Ch
anthemums are not at all fastidious, ar
few of these would brighten things from
summer right through the autumn mont

Hyacinths tall and thin

("Winton").—No doubt the fact
the Hyacinths having been gr
in such large pots has a good
to do with the unusual length they h
attained. It is a mistake to use such h
receptacles. Three bulbs will do well i
6-inch pot. It looks, also, as if undue for
has been carried out. Especially at first,
very moderate warmth should be given
plant.

TREES AND SHRUBS

Plants arriving in frosty weather

What is the proper method to follow
one has a large lot of hedging plants ar
in very frosty weather? A large quantity
Privet Oval, Laurels, and Thorn arr
here on February 11th in about 12 degs
frost and a very cold wind. In my abse
the gardener employed planted them all
quickly as possible in trenches and holes
had dug a month before. Do you think
plants will live, and can anything be d
now to assist them to recover? Soil is li
and sandy. I am told the plants ought
have been put in a good shed, without
doing the mats and wrappings, and allo
to remain until the weather was suitable
planting, even if for several weeks.

"Frost.

[It was certainly risky planting these
jects during frosty weather, more especi
as the trenches and holes had been prepa
some time in advance. Had the holes,
been opened and the plants put in at o
but small risk would have been run,
even as it is, all three subjects being q
hardy it is possible that the bulk of th
will survive. There is really nothing
can be done, as we gather the planting
somewhat extensive. Had it been a case
but a few plants a good plan would h
been to give a little protection with Spr
or Pine branches so as to prevent a too r
thaw. As it is, when the frost is quite
of the ground go over all the plants and tr
down the soil firmly all round them. W
hardy shrubs or plants of any kind ar
during frost it is certainly best not to
pack, but set in a quite cool shed or c
until the frost disappears.]

The Warratah

Can you give me some cultural infor
tion about the Warratah plant (Telo
speciosissima)? Can it be raised from s
and, if so, where can I obtain same? S
time ago I met a man who assured me he
seen it growing upon the uplands of Austr
which were affected by frost, so it occur
to me that it might be possible to succ
with it in the open here in a sheltered p
tion; on the other hand I am equally
assured it can only be grown in a gr
house in this country.

Canterbury. Percy Underwoo

[Telopea speciosissima comes from N
South Wales. It grows well at Ludgvan F
tory, near Penzance, Marazion, and Tres

cilly Isles, but Kent has too cold a winter, ow and then, for it. Treseder, The urseries, Truro, may have young plants.]

VEGETABLES

omato growing

(R. Gibbs).—Your best plan will be to purhase the book "Commercial Tomato Culure," by the Lea Valley Correspondent at s. 6d., from this office, postage 2d. extra. he synopsis of the contents is as follows. hoice of site, Structure of Houses, Venilating and Heating, Preparation of Borders, Ianual Treatment, Soil Sterilisation, Proagating, Planting and Stoking, General ulture, Control of Common Diseases, rimming and Tying, Clearing and Cleaning of Houses, Picking, Packing and Gradng, Organisation of Labour. It is impossible o give any answer as to how many pounds er plant you could produce, so much deends upon variety, soil, and the grower. As o the best type of house, you should conult our advert. columns and write to several irms asking for details of their Tomato ouses. Any good firm can be relied upon to ive you value for money.

CHRYSANTHEMUMS

topping Chrysanthemums

Please tell me in which months to stop pecimen Japanese Chrysanthemums: R. C. ulling, Peace, F. J. Flemming, Miss D. L. thron, Dr. A. M. Inglis, Majestic, Francis olliffe, Captain Fox, Edith Cavell, Louise ockett, and Mona Davis.

Boxmoor. REGULAR READER.

[R. C. Pulling (natural break), Peace natural break), Mrs. F. J. Flemming (first veek in May), Miss D. L. Athron (natural reak), Dr. A. M. Inglis (mid April), Majesic (first week in May), Francis Jolliffe natural break), Captain Fox (third week in Iay), Edith Cavell (natural break), Louise ockett (natural break), Mona Davis (end of pril).]

MISCELLANEOUS

Vild birds

I shall be glad to know of the best food o give wild birds? The small ones like at and cocoanut, but what do blackbirds ike best? M. I. Y.

[During hard frosty weather birds re not so particular as to their food abits. Their own natural supply being or the time non-existent, they have to be ontent with what they can find. Blackbirds eed to a very great extent on wild and culivated fruits as well as slugs, snails, inects and worms. We have always found hat blackbirds and thrushes feed well on craps of bread and meat during a period of ard frost. They appreciate bacon rind cut nto small pieces. In certain districts bird ife suffers very much from thirst during ard weather and a shallow pan of drinking ater is very much appreciated. As you say, he small birds are fond of fat and cocoanut, lump of suet is especially relished.]

Ioist Potpourri

Can you through your paper tell me a ood recipe for making moist pot-pourri? shall be grateful. J. T.

[This enquiry has been submitted to Miss ekyll, who kindly replies:—

Potpourri.—The ingredients are princially Rose petals, Lavender, and the leaves f Sweet Geranium, Sweet Verbena and Bay. nything of a lasting sweet scent can be dded, such as shavings or sawdust of pencil edar. Then a mixture of bay salt and common salt, and Spices, both whole and in powder. The Roses are gathered when it is quite dry and had not rained the day before; the petals are pulled off and laid out to get half dry, so that they are leathery and have shrunk to half their bulk. They are put into a glazed jar about two handfuls at a time, pressed down tightly and covered with a good sprinkling of the salt mixture, and left till the next picking, covered with a piece of wood or anything convenient with a weight on the top. The Sweet Geranium leaves are torn up and partly dried in the same way before being pressed and salted. Bay leaves, Sweet Verbena and Lavender flowers are all of a drier nature and can be put straight into the jar without drying, but all alike are salted and pressed. The Spice mixture.—Violet powder, Cloves, Allspice, Mace, all ground, some whole Cloves and Mace, Gum Benzoin and Gum Styrax ground; the Violet powder predominating. This is all mixed together and the quantity should be enough to give a thin powdery coating to the whole of the material when this is mixed. At the final mixing the mass in the jar is broken up and poured through the hands, the Spice mixture being thrown on by degrees. The whole is then thoroughly mixed; when done it should feel just damp. It is then ready to be put into any jars or bowls in which it is to remain.]

Families of cultivated plants

(Swanley Student).—The most useful work for your purpose is the recently published book, "The Families of Flowering Plants," by J. Hutchinson, of the Herbarium, Kew; Macmillan and Co., 20s. In this work the families of Dicotyledons are traced step by step from one family or group to another. The work, which is on somewhat original lines, is provided with an analytical key, a good index, and is freely illustrated by clear line drawings.

SHORT REPLY

Halcombe, North Ireland.—We cannot find a single offer of seeds of the Acanthus species you want, but plants are offered as under:—Messrs. Wells, Junr., Merstham, Surrey, offer Acanthus spinosus at 9d. each, *plus* packing and carriage charges. Mons. Henri Correvon, Floraire, Chenebourg, Geneva, Switzerland, is the only firm we know offering Acanthus spinosissimus at 75 centimes, Swiss, *plus* packing and postage.

NAMES OF PLANTS

W. G. P.—2, Probably Cotoneaster horizontalis; 3, Pyracantha Lelandii (not a Cotoneaster); 4, Eccremocarpus scaber, an annual climber which will winter in the open in the most favoured position only, such as the foot of a south wall, but quite a success for summer use in the open.

J. N. B.—The large-leaved kind is undoubtedly Escallonia macrantha, and the small leaf may be E. exoniensis, but, to determine this, flowers are necessary.

ENQUIRY

Primula Marchioness of Exeter and its pink sport

I shall be glad to hear if any readers know of the above Primula and to know if it still exists to-day. It used to be wellgrown in the Guildford and Godalming districts in the early nineties. The Marchioness was a most glorious double white, but the pink sport to my mind was not quite such a good doer. Six of the grandest plants I ever saw were shown at the Guildford show by a Mr. Powell. The judges were so impressed by their culture that they gave a National Award. It was propagated in the same way as the old Primula alba plena, which also seems to be lost sight of. I was told that the Marchioness was raised by a Mr. Gilbert in the Midlands. This I cannot verify anyway. Any information as to its existence will be welcome, as it is many years since I last saw it. The habit is all one could wish for. B. NASH.

The Grange, Sutton, Surrey.

Report of condition of horticultural crops on February 28th, 1929

Broccoli (spring hearting).—Much damaged by frost, especially with the earlier maturing varieties. Some damage reported on Cornish crop.

Broccoli (sprouting).—Some damage by frost in most counties. No damage reported from Cornwall where crops are up to average.

Cabbage (autumn planted). — Badly damaged by frost.

Cabbage (autumn planted for greens).—Badly damaged by frost and drying winds.

Cucumbers (under glass).—Good generally but plants drawn in some cases by hard firing and lack of sun.

French Beans (forced). — Satisfactory. Early crop prospects reported below average in Sussex.

Lettuce (frame).—Somewhat below average.

Mint (forced).—Satisfactory generally.

Radishes (forced).—Good.

Rhubarb (forced).—Satisfactory supplies.

Rhubarb (natural).—Very backward, in fact crowns have hardly started, and crop will probably be late.

Sea Kale (forced).—Supplies up to average.

Spinach.—Winter crop damaged by weather.

Tomatoes (under glass).—Plants retarded by weather conditions.

Anemones.—Some damage by weather. Flower bud production slow in Cornwall. Fair prospects in the Scilly Isles.

Arum Lilies.—Badly cut by frost in Cornwall. Satisfactory in heated houses in Sussex and Hertfordshire.

Carnations, perpetual (under glass).—Flowering up to average.

Daffodils and Narcissi (indoor).—Cornwall. Average though not as free flowering as last year; in Scillies late varieties promise a full crop, others finished.

Daffodils and Narcissi (outdoor).—Backward; prospects for a late crop are good. Poeticus varieties promise a full crop in the Scilly Isles.

Hyacinths (forced).—Average crop.

Tulips (forced).—Satisfactory flowers.

Violets.—Satisfactory in Hertfordshire and Middlesex. Badly cut by weather in Cornwall and Sussex.

Wallflowers. — Severely damaged by weather.

Mimuluses

These have been so much improved of late years that they are deserving of extended cultivation, being exceedingly showy and very enduring. With plenty of water and partial shade they will continue blooming for months. For the embellishment of slightly shaded windows we know of few things more telling and useful than these; they are at home either in pots or baskets in a good, rather light, loamy soil. Some of the kinds are very curious, having hose-in-hose flowers, and the majority of the different varieties are rich in colour and very varied in the character of their quaint markings.

OBITUARY

THE LATE MR. S. M. SEGAR

An Appreciation

Mr. S. M. Segar, of Messrs. Wills and Segar, South Kensington, London, passed away recently at a ripe old age. Mr. R. F. Felton writes:—"The horticultural and floral world has lost an example which all who are interested in either branch may well try to emulate. Forty years ago he laid the foundations of the great plant and floral decorative industry of which he was undoubtedly the pioneer. Personally, I have known him intimately for just upon 40 years, and any small attainments of mine are directly due to his early influence and friendly counsel. His love of plants and the cultivation of them in his young days fitted him for the great decorative work in which he was destined to become a master-hand. The present generation of florists are reaping the reward of the seeds which were sown by this great man. It is a comfort to know that he has left two worthy sons to carry on the work."

Ley Hunter's Manual

To all who feel any interest in how the inhabitants of this island lived in prehistoric times, to those interested in word meanings, and to all out-of-doors people who like to have an object in their tramps, "The Ley Hunter's Manual"* will appeal. The word "ley" is used to describe the old straight tracks of. the men of the Stone Age. Mr. Watkins makes out a very good case for his theory that such things were necessary and did exist, and although he advances quite new theories, he proves his case.

Briefly, his idea is that some things, such as salt and flints, had to be fetched in some districts from long distances by prehistoric men, and so they marked the most direct routes (*i.e.*, the straight ones, or leys) to the places where the necessities were obtainable by mounds, mark-stones, beacons, notches in hills, trees, and ponds in alignment, and that some of these alignment marks, or traces of them, still exist.

This book suggests what the novice in search of leys should look for, how to discover the position of the tracks by place names, map work, field work, and a suggestion for aeroplane work. It contains a list of proved leys and a good index, and the illustrations, although awkwardly arranged, are excellent. A good, handy text-book on a fascinating out-of-doors subject.

---

* "The Ley Hunter's Manual," by Alfred Watkins. Simpkin, Marshall, & Co.; 2s.

LATE REPLY

Gladioli corms to flower in October

(A. C.).—Not knowing the varieties, it is hardly possible to advise as to treatment, in general, for inducing these plants to bloom at a stated time. Some are naturally early bloomers, others, if planted out-of-doors about the end of April would bloom in October. If you have named varieties, any good catalogue would tell you whether any particular variety were early, medium or late. The only thing to retard the flowering period is to keep the corms in a cool dry place, until, say, the end of April, and after planting in the boxes, set these on the north side of the wall. Under these artificial conditions, no one can really say when any particular sort would bloom. Under ordinary cultivation the Gladioli requires fom five to six months from time of planting until the flowers open.

Wisley Trials

The Royal Horticultural Society will c
out trials of early-flowering Chrysanthem
and of perennial Gaillardias in their gard
at Wisley during the coming season. T
plants of each variety for trial should re
the Director (addressed to him at R.
Gardens, Wisley, Ripley, Surrey; Rail
Station, Horsley, Southern Railway) on
before April 6th, 1929. The necessary e
forms will be sent on application to
Director.

Transplanting large trees and shrubs

Owing to unforeseen changes it often
comes necessary to shift large and es
lished specimens, and many are the lo
unless special precautions are taken, esp
ally among evergreens; but if the head
such trees, shrubs, and also the
branches are reduced to nearly half t
original length a large percentage will
vive. Many regret this sacrifice of foli
but it pays in the end and it is surprising
quickly most things recover. May is the
and accepted time for planting Hollies, B
boos, etc., but if treated as above we w
not hesitate to move such things at any t
during the winter, as the month of Ma
too precious for such work in private gard

Prick-off Begonias

The earlier, in reason, the tiny seedl
are pricked off the earlier will they blo
and one is always anxious to have t
plants flower the first season, so that the
may be marked for growing under gl
while the poorer forms are retained
bedding purposes. It is rather a ted
business, but as the smallest and latest s
lings are frequently the very best, it is es
tial that every one be grown on unti
blooms, and so proves its value, or otherw

PERPETUAL CARNATION

For flowering in the open Border or unde
glass all the year round. Our Catalogu
has been posted, and is sent Post Fre
on application.

STUART LOW CO., Bush Hill Park, Enfield, Md

Save seeds from cold, wet, wind, and birds!

A Customer writes:—"Our flower beds have been a flame of colour the whole summer. In previous years flower seeds planted in the open beds have been a source of great disappointment, but *your* CONTINUOUS CLOCHES *have undoubtedly made seed-raising a certainty.*"

Now is the time to make yourself independent of the weather. Start early, and make a full season's use of the cloches. Seed-raiser size costs less than 4d. per foot run of row.

Customers enthusiastic.

Free list now from the Manager.

LAWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS' **LAWN GUANO**
(A Compound Fertilizer)

The safest dressing for turf. It feeds the turf over a long period and will not burn or discolour the grass. Lawn Guano quickly strengthens the roots and encourages a dense growth of fine grass. As used by important clubs and municipalities. Apply now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.

Prices, in Bags : Carriage paid	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
	3/-	5/-	9/-	15/-	25/-

FISONS' **LAWN SAND**

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed, such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.

Prices, in Kegs : Carriage paid	14 lbs.	28 lbs.	56 lbs.	1 cwt.
	5/-	9/-	16/-	27/6

FISONS' **BASE FERTILIZER**

should be incorporated with the soil before sowing grass seed. Specially prepared to promote strong root growth and give new grass a good start. Use 4 ozs. to the sq. yd. a few days before sowing the seed.

Prices, in Bags : Carriage paid	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
	3/-	4/6	7/6	12/6	20/-

FISONS' **GRASS SEEDS**

are the finest procurable, being specially tested before selection.
Special Mixture (for Bowling and Golf Greens, finest grasses only).

Prices, in Bags : Carriage paid	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
	15/6	30/-	58/-	110/-	210/-

Where
can I obtain?

THE difficulty of not knowing exactly where you can secure some special line needed for the garden — probably recommended or seen elsewhere—is easily overcome by utilising the services of "G.I."

Considerable care over a number of years has been given to tabulating information on all aspects of gardening that shall prove of assistance to our readers.

Write us, therefore, when you want to know where to obtain any seeds, plants, shrubs, horticultural implements, sundries, or other accessories to the garden that you do not see advertised in our pages.

Address your enquiry, with stamped envelope for reply, to —

THE ART AND CRAFT OF GARDEN MAKING

By THOMAS H. MAWSON, F.L.S.

THIS encyclopædic standard work contains the results of half a century's practical experience and forms the most complete compendium of garden design ever published. The examples illustrated have been selected from a wide range, both Old and New, the majority being of modern design showing General Lay-Outs, the House in relation to the Garden, Terraces, Gateways, Drives, Avenues, Garden Houses, Lawns, Pergolas, Rock and Water Gardens, Statuary, Tree and Shrub Grouping, Kitchen Gardens and Orchards, with notes on the selection of Trees, Plants and Shrubs for Garden and Park.

The illustrations are not only a delight to the eye, but so clear and practical that an amateur could work from any of them. Indeed, what this book does not tell about the delightful craft of garden-making can hardly be worth telling.

Sent on APPROVAL if cash accompanies provisional order. Remittance refunded if book is found unsuitable.

B. T. BATSFORD, Ltd., 94, High Holborn, London

GARDEN DESIGN *and* LANDSCAPE GARDENING

GARDEN DESIGN AND LANDSCAPE GARDENING are not quite the same thing. One deals with those more intimate portions of the grounds in the immediate neighbourhood of the house that form the garden proper; the other attempts by the skilful disposition of vegetation to focus the beautiful distance, by furnishing the bare spaces to enhance its charms, or by effecting necessary clearing of superfluous material to give its natural beauty its true value. In both, the principle is the same; the organisation of forms, colours, of all the elements of beauty, of the successive products of progressive seasons from spring flowers to autumn tints, and using them with a fine regard for their present effects and future potentialities.

PRIMULA FLORINDÆ, F.C.C., R.H.S.

The Giant Cowslip Primula

A magnificent new species, attaining a height of 4 ft., with 60 to 80 fragrant golden-yellow flowers in an immense mop-head, with large, handsome leaves. Perfectly hardy, and of the easiest culture in a damp spot. Fine plants.

1/- each ; **10/6** doz.

LILIUM REGALE, F.C.C., R.H.S.

The Finest of all Garden Lilies

Growing from 4 to 6 ft. high, with several large trumpet-shaped flowers, pure white within, shading to golden-yellow in the throat and shaded with wine-colour on the outside. Very fragrant. It thrives in any good garden soil. Fine flowering bulbs.

2/- each ; **22/-** doz.

GENTIANA SINO-ORNATA, A.M., R.H.S.

The Finest Autumn-flowering Alpine in cultivation

It is extremely hardy, and flowers from September till late November, with beautiful upstanding trumpets of most brilliant azure blue. 3 inches high. Very vigorous in growth, liking leaf mould.

5/- doz. ; 25 for **9/-**

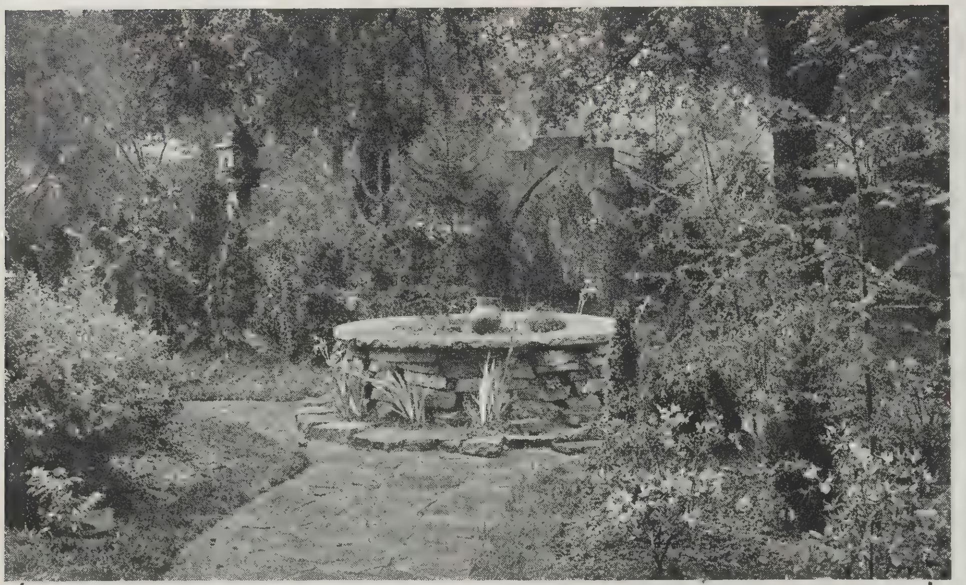
the Charm of an Old World Garden



A Monastery Garden
as exhibited by us at "Chelsea" last year.

THE OLD-WORLD GARDEN, quiet and restful, a true tonic to mind and body, is one of our SPECIALITIES.

> *Extract from* GARDENING ILLUSTRATED, *May 26th, 1928:*
> *"For those who love a quieter and more restful picture, one is provided by Messrs. Baggesen's, of Pembury, Tunbridge Wells, who show an Ancient Monastery garden entered by an ancient Gothic arch, taken from a Monastery and about seven centuries old. A central paved walk leads from the entrance to a well-head at which another path runs at right angles, forming a cross with the well in the centre. Beyond this walk one enters a picturesque little garden with winding paths and shady nooks most useful in character, and the dark Pembury Stone gives additional restfulness to this delightful little scene which takes one far away from the bustle of London and Chelsea. It is quiet, unobtrusive, artistic, natural, and therefore wholly delightful."*

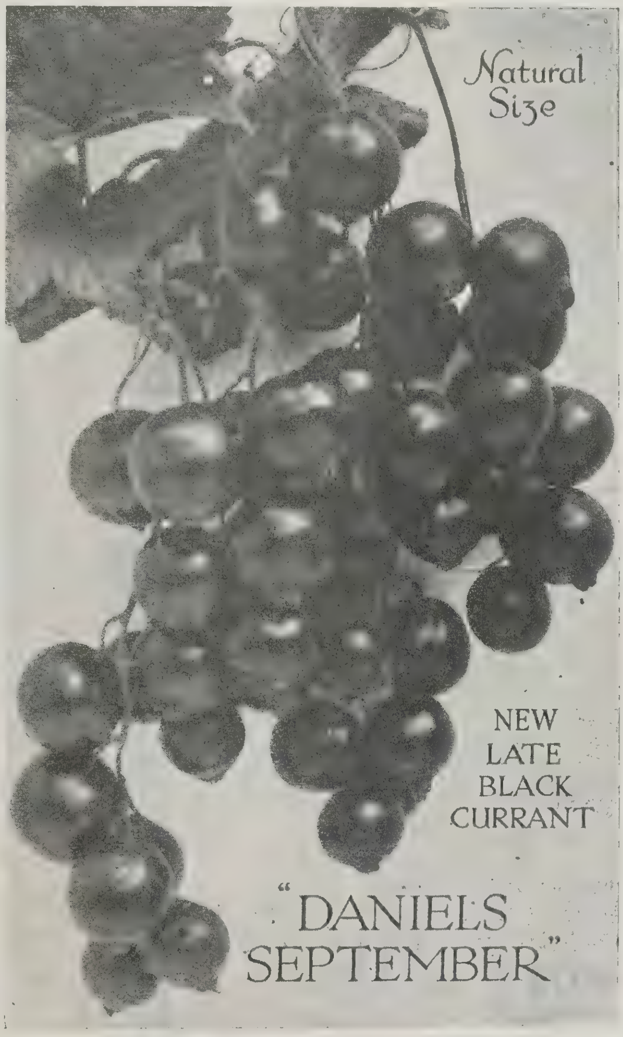
(Kindly mention this paper)

HILLIER & SONS, *West Hill Nurseries, WINCHESTER*

THE RECENT FROST
has in no way affected these Bushes which are in splendid condition for PLANTING NOW



THIS magnificent New Late Black Currant has been awarded a FIRST CLASS CERTIFICATE and also an AWARD OF MERIT by the ROYAL HORTICULTURAL SOCIETY.

It is an immense cropper, and the bunches are exceptionally large, with enormous deep black berries. It is also a good disease resister, and is becoming increasingly popular each year.

EXTRA STRONG SELECTED FRUITING BUSHES
1/- each. 10/- doz.

Packing and Carriage Free on all Orders of one dozen Bushes and over.

Descriptive and Illustrated Catalogue of Bush Fruits free on application.

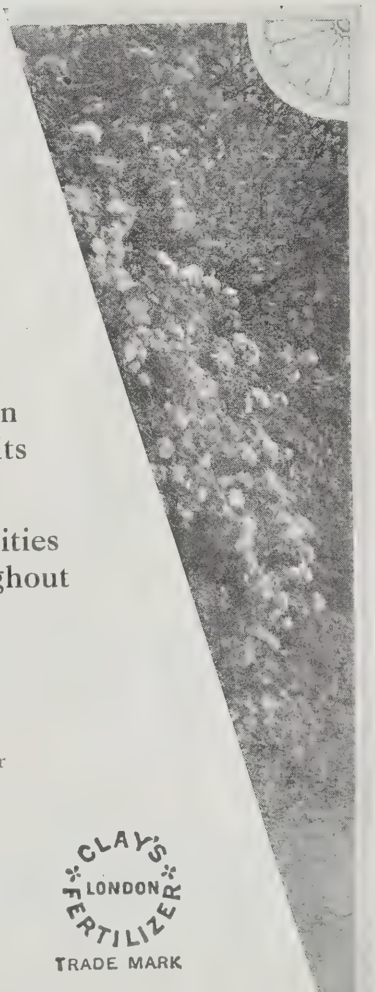
CLAY'S

WAS ALREADY FAMOUS AS A

FERTILIZER

IN PRIVATE GARDENS AND TRADE ESTABLISHMENTS



AS in 1879, when advertised in this paper's first issues, so in 1929 it remains the best artificial manure and plant food.

From all types of garden enthusiasts has come testimony to its great value for producing an abundance of

Flowers, Fruit, Vegetables, and Foliage of the highest quality

It has survived a host of competitors, and its reputation is as safe, certain, and lasting as is the effect of its application to the most delicate or to robust plants.

CLAY'S is used by Government and Local Authorities and by Professional and Amateur Gardeners throughout the World.

Sold everywhere in TINS at **10d.** and **1/6**, and in BRANDED and SEALED BAGS:—7 lbs., **3/6**; 14 lbs., **6/-**; 28 lbs., **10/-**; 56 lbs., **18/-**; 112 lbs., **32/-**. Or, if unable to obtain locally, direct from the Works, carriage paid in the United Kingdom for Cash with Order (except TINS).

NEW TOMATO
"*Stonor's M.P.*"
Mostly Pinks (*i.e.*, Top Grade).

THIS Novelty is the result of many years' work, hybridizing and selecting. The best strains in commerce were used; and the result is a Tomato which is perfect in shape, size, and colour, and which is unique in that it is never affected by the hard greenback, now so prevalent. Being very short-jointed and wonderfully prolific, it is an ideal subject for small houses. The letter below is proof of its quality, and the hundreds of orders received from professional growers in all parts of the world since its introduction show that it is likely to prove an advance on any variety yet raised.

Strong Twice Transplanted Plants, for final planting,
6/- per doz, **16/-** 50, **25/-** 100.
Once Transplanted, **3/-** per doz., **8/-** 50, **14/-** 100.
Seeds, **2/-** 45, **4/-** 100, c.w.o. carriage paid.

Copy of letter from Rear-Admiral W. Elder, C.M.G., Copse Hill, Sarisbury, Oct. 9th, 1928:—

"Out of a house 22 ft. by 10 ft. planted with 46 plants of your tomato 'M.P.,' I have picked 544 lb. of fruit, which realised wholesale £13 2s. 11d. The crop lasted from June 18th till September 14th. There was not a single 'greenback,' and all the fruit was of a good shape."

F. STONOR, F.R.H.S., Parkgate, Hants.

Scions! Scions!! Scions!!!

OF THE

NEW APPLE "B.G."

Owing to the great demand for the "B.G." (Bushy Grove) Apple trees, we have decided to offer

SCIONS at 1/- EACH

in order to satisfy a greater number of persons eager to obtain this variety of Apple.

Grafting wood will be sent out in lengths according to the number of scions ordered. Estimated length of scions average three inches, containing two good healthy buds with sufficient space left for cut to be made.

MAIDEN TREES 15/- EACH

There is not another English Apple on the market that has all the good points of the "Bushy Grove."

The "B.G." received the Award of Merit from the Royal Horticultural Society in 1922. Since then it has been awarded Two First-class Certificates, Three Silver Medals, and one Bronze Medal. First prizes have been secured almost every time the "Bushy Grove" has been exhibited. Orders (with remittance) will be despatched in rotation, as this offer of Scions is subject to a limited stock.

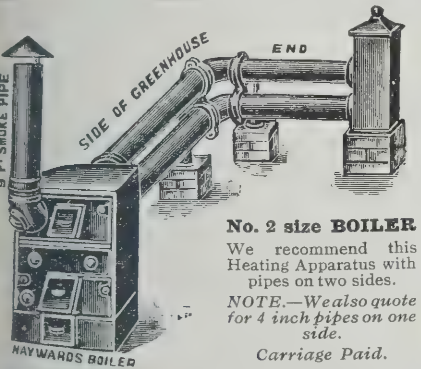
HAYWARD'S EXHIBIT AT ROSE & ROYAL CHELSEA SHOWS

Any firm who can give better value for money than can be got elsewhere should exhibit their Greenhouses. Thousands of readers of GARDENING ILLUSTRATED from every part of the Kingdom have now seen **HAYWARD'S** No. 20A, No. 22A, and No. 23, and their Heating Apparatuses at the above Shows last year and proclaimed them better value than ever. We guarantee to supply them exactly as those that were exhibited, therefore you now have a splendid opportunity of getting a good Greenhouse at the cheapest possible price that a good one can be supplied at. We supply everything of the best quality and finish, fixed up here in sections into its proper place and carefully numbered ready for bolting and screwing together again on delivery, 21 oz. glass cut to the exact sizes and angles for every opening, carefully packed in boxes with all bolts, screws, brads, zinc, and putty. YOU have nothing extra to pay for, we supply everything. Carriage Paid to your address in England and Wales, also 500 miles from London into Scotland and Ireland, 10 per cent. extra, all at our risk.



No. 2 size BOILER

We recommend this Heating Apparatus with pipes on two sides.

NOTE.—We also quote for 4 inch pipes on one side.

Price 5/- post free in U.K.

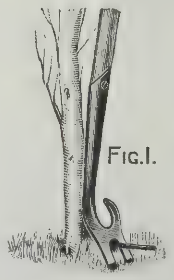

FIG. I.
Fig. 1 shows how it is applied to a sucker. The "U" opening has a sharp chamfered edg and a little downward and backward pressure against the stem of the tree ensures it removal. It is assumed, of course, that a handle of suitable length has been placed the socket.
Another troublesome job is the REMOVAL of PLANTAINS, DAISIES, etc., FROM LAWNS, and her again will Davidson's Spud prove effective from the same point of view. It is used at firs for LIFTING, and then by placing the wide opening behind the plantain, it can be dragged o to the grass. All work is done WITHOUT BENDING THE BACK.
Without the long handle it can be used for lifting seedling plants
BROCHURE "E" (perhaps even more interesting than Brochure "D") post free.

Special Jubilee Message to "GARDENING ILLUSTRATED"

By SAMUEL RYDER Esq. J.P.

(Chairman of 'Ryders of St. Albans')

As one of its oldest readers and advertisers I take keen pleasure in writing these few lines of personal congratulation to GARDENING ILLUSTRATED upon the occasion of its Jubilee.

To all who have followed, as I have, the yeoman service to horticulture, and, even more, the progressive spirit which has for fifty years dominated its editorial policy, the significance of the event will not be gainsaid.

Fifty years ago I well remember the interest with which I purchased and read a copy of its first issue and became one of the original contributors to its advertising columns.

At that time my business interests served, almost exclusively, the large and professional grower.

Some twenty-five years later I embarked upon the bold plan of bringing the finest quality seeds within the reach of the hitherto somewhat neglected amateur. This, as everyone now knows, was accomplished by the introduction of Ryders Quality Seeds in Popular Packets.

The immediate result of this democratic decision was to attract hundreds of thousands of people to the delightful possibilities of home gardening. Hitherto the possession of a garden full of beautiful flowers and fresh home-grown vegetables had been regarded as an expensive hobby for the rich or for those who made it their business to grow for profit.

To-day one of my greatest joys is the knowledge that Ryders Seeds are being sown in countless numbers of small gardens tended and cultivated in most instances by their individual owners.

This Ryder policy very naturally led to a keen desire for knowledge concerning the best means of cultivation and horticultural matters generally. Many sought this information in the pages of GARDENING ILLUSTRATED, and it is the splendid way in which those responsible for this paper responded to this demand of its new readers which attracted my admiration and prompts this personal tribute to their success.

There is indeed a striking parallel between the whole-hearted manner in which GARDENING ILLUSTRATED supplied the information required by the new army of amateur gardeners and the policy responsible for supplying them with "Ryders Quality Seeds in Popular Packets." For in both instances the high quality of both garden seeds and garden literature is strictly maintained.

As far as Ryders Seeds are concerned I venture to say that no finer quality seeds are obtainable anywhere at any price. From the moment that my popular plan of distribution was put into operation the keynote of Ryders success has been RELIABILITY. As a result, each year has witnessed the consistent growth of this huge business and with this growth has come an ever increasing capacity for securing for Ryders Customers more and more Novelties and offering them in most instances far in advance of their appearance elsewhere.

In conclusion I would say that a straightforward and intelligent appreciation of modern gardening requirements is the mutual bond which links one of the foremost gardening papers of the day

GARDENING Illustrated

Founded by W. Robinson,
Author of "The English Flower Garden"

o. 2610—Vol. LI. MARCH 16, 1929 [Prepaid Annual Subscription to any part of the World, 13/-

A Red Letter Day

IFTY years ago William Robinson founded Gardening Illustrated; and it is with the spirit of pride in the past and th in its future that we present this bilee Number to our readers. It has been ring the lifetime of Gardening Illus- ated that the great change for the better s been wrought in the ways and aims of rticulture. Until about the year 1879 pet bedding and ribbon borders were all fashion in gardening. There was one d level of general treatment of designed ls in lawns and terraces. There were centric rings of Geraniums, Calceolarias, Lobelias—there were ribbon borders, cles, stars, and crescents bedded with the ne plants and monotonous rings of heveria. It was only in out-of-the-way ces in good cottage gardens, country tories, or in other gardens where the ners had not the glass necessary for wing tender plants for the summer dis- v that the value of hardy plants was ap- ciated. In such gardens were seen old rambling Roses, Clematis, Jasmine, Honeysuckle, Primroses, Polyanthuses, Lilies—Martagon, orange, and Madonna—and other old-world delights.

The whole horticultural world was being encouraged and stimulated by the constant exhortations of William Robinson, to whose vigorous championship of hardy plants and the better ways of using them the delights of our present-day gardens are mainly due. In Gardening Illustrated were pursued those ideals of natural gardening development which found his full expression. To him, also—and this is a point we are apt to forget—we owe the beginning of our knowledge in the use of rock and Alpine plants.

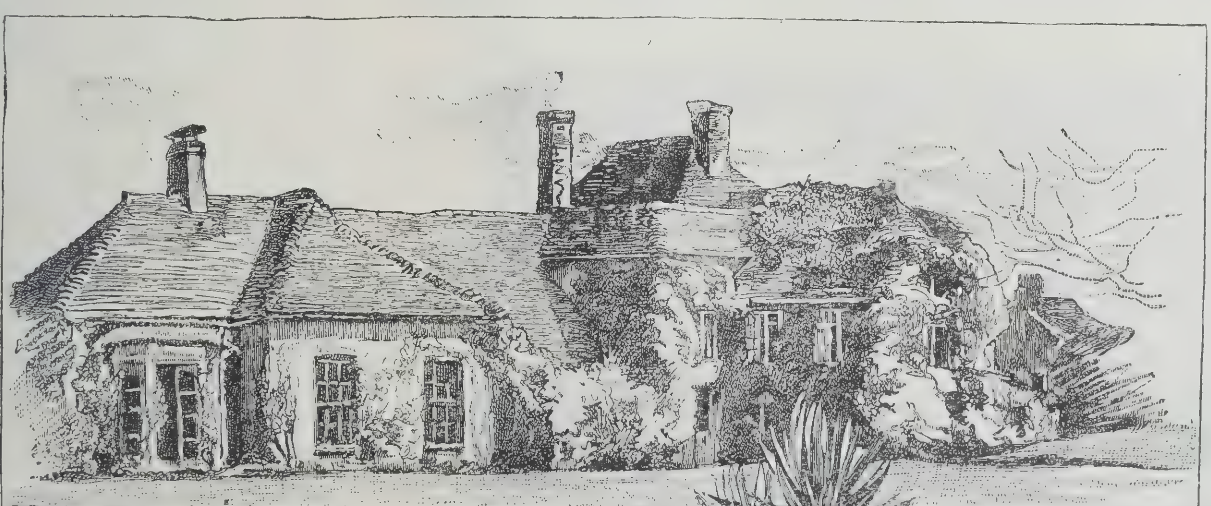
Other workers among flowers were alive to the possibilities of better gardening. Foremost among them was Dean Hole, whose name will for ever be associated with the Rose.

The travels of Peter Barr in the hills of Spain and Portugal enriched our gardens with species of the Daffodil, and G. H. Engleheart, happily still with us, was among the first to manifest the possibilities of the hybridisation of Daffodils. Among other eminent horticulturists of the period whose names are familiar to all were G. F. Wilson, the owner of Wisley, Lord Penzance, who was at work on Sweet Briars, the Rev. C. Wolley-Dod, and Canon Ellacombe.

It remained for Miss Jekyll, still our guide and counsellor, who in her earlier years was trained as an art student, to point out that gardening was not—as it might well be—treated pictorially. Her writings are instructive and inspiring guides to all interested in beautiful colour effect in the garden.

Fifty years is, after all, a very brief period when compared to the age of the art and practice of gardening, which is one of the oldest, if not the oldest, occupation of man. If gardening progresses at the same rate what will the next 50 years bring?

One of the greatest changes in English gardens in recent times is due to plant introductions mainly, though not entirely, from



Gilbert White's garden at Selbourne

From a sketch by Alfred Parsons, April, 1879. Reproduced from the first volume of "Gardening Illustrated"

the uplands and mountain ranges of Western China and Tibet.

Thanks to intrepid plant-hunters, Fortune, Douglas, Henry, Wilson, Farrer, Forrest, Kingdon Ward, Purdom, and others, our gardens have been enriched in Roses, Rhododendrons, Buddleias, Berberis, Viburnums, Lilies, Primulas, Meconopsis, and other hardy flowers. Some of the species have a marked effect not only on our gardens, but also on the countryside.

The field for the collector is vast, but we are tempted to ask, will it not be worked out within the next 50 years? This has been the fate of the Orchid hunter. He has worked himself out of his job, and the amazing new Orchids now produced are practically all hybrids raised in nurseries.

Another great change now taking place in gardening is the increased interest in public parks and gardens. Then there is the tremendous advance of the Royal Horticultural Society, with two magnificent halls in Westminster, its well-equipped garden at Wisley, and a membership of over 26,000 Fellows. It seems incredible that at the close of 1887 the Royal Horticultural Society was in debt £1,152 and the total number of Fellows was 1,329, of which over 200 resigned the following year. If the amazing progress made by the Royal Horticultural Society in the past 50 years is any criterion, then the future of horticulture should, indeed, be one of great prosperity.

As we turn over the pages of the first volume of Gardening Illustrated we realise something of the great changes that have taken place not only in gardening, but also in printing during the period under review.

In the method of illustrations there is a very marked change, for the old woodcuts, some of them exceedingly beautiful, have been replaced by illustrations from half-tone blocks. If the printing of illustrations co tinues at the same rate of progress what wi the Centenary Number be like? Is it poss ble that the cost of good colour printing wi be so far reduced that it may replace the hal tone illustrations?

Gardening Illustrated has grown u with its readers. It caters for the mar amateurs advanced in horticultural know ledge as well as for the professionals in nee of a journal that could interest them in th conduct of large gardens or in the care rare plants in their charge.

Since Gardening Illustrated came unde the control, nine years ago, of Ben Brothers, Ltd. (now probably the large publishers of technical newspapers and bool in the kingdom), it has steadily consolidate its position. Only a journal of sterlin merit laid on sure foundations and holdin fast to the high purposes of its founder ca attain this happy distinction, and we loo forward with every confidence to the future.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Primula microdonta

Although the type was collected many years ago, it was scarcely known outside botanical gardens

THIS is a wonderful species and a welcome addition to the Sikkimensis section. It was re-introduced from S.E. Tibet in 1924 by Capt. Kingdon Ward, who found it at high elevations in shady bogs, sub-Alpine meadows, and also along the margin or open belts of the forests.

The leaves are oval and usually from 4 inches to 6 inches long and from 2 inches to 3 inches wide, but these vary in size according to the various forms. As the specific name indicates, the margins of the leaves are minutely toothed, glabrous on the upper side, and rugose underneath. The scapes of the smaller forms are from 15 inches to 18 inches in height, with a terminal umbel; others may reach 3 feet in height and produce from two to four whorls of flowers (an unusual feature of the Sikkimensis section). Th flowers of P. microdonta and its mar varieties are extremely fragrant, of a noddir habit and with a distinct thick band of whi meal in the throat. It is one of the mo variable coloured species in the whole genu producing white, pale yellow, violet, ar many tones of wine shades. In cultivati all these forms have done remarkably w and it has been proved that by careful sele tion and isolation these will come fairly tr to colour from seed.

The most distinctive are:—P. microdon (white form), 2 feet to 3 feet, with two to fo whorls of flowers; P. microdonta Alpico 15 inches to 18 inches, pale yellow; and m. Violacea, with violet flowers, from inches to 24 inches in height. All thrive well-drained northern borders among shru on the side of woodland walks, or a cool, ha shady position in the rock garden; in ve warm districts they may be planted in a b or on the banks of a stream. All enjoy fairly rich soil made up of good loam, le soil, and sand. Primula microdonta and its varieties are most desirable garden pla and when better known will become ve popular.

J. A.

Moniaive

Primula microdonta var. Alpicola

Flowers pale yellow. Height 15 inches to 18 inches

Truthful catalogues

Messrs. Barr and Sons' protest in yo issue of February 23rd, page 119, seems have effectually silenced those critics w imputed deliberate misrepresentation nurserymen's catalogues.

Any reasonable and fairly experienced g dener will readily admit that, taking th on the whole, catalogue descriptions of pla are not unduly exaggerated, and that unl an amateur possesses the same experie and skill as the professional gardener, l ample time at his disposal, and p meticulous attention to details he can hope to produce the same effects as the tr grower; and that is no reason why a pl should be described according to the l average amateur standard rather than high standard attained by experts.

Furthermore, catalogues are not the pl for full and detailed cultural instruction. required, this can always be obtained in b form at very reasonable prices.

I must, however, return to the question colour description. Messrs. Barr and S state: "It is simply impossible to so scribe a flower as to give the same impress to everybody." I agree, and it is this fact that called forth my first plea for a standard colour chart.

Further, "No two people agree as to the correct names of colours, excepting the primary colours." Again I agree, and here I wonder how many could name offhand the primary colours?

Still further: "It is open to question whether varying shades of colour give the same sensation to all." Exactly!

These three statements, coming from so reputable and so well-known a firm as Messrs. Barr and Sons, carry considerable weight and may be almost said to represent a general trade statement to cover the shortcomings of colour description.

I take a different view, and look upon the statements as a striking recommendation for the introduction of a standard colour chart. Looking at it from any point of view, all the lifficulties enumerated would disappear into thin air if such a chart existed. It would then be possible to describe a flower so as to give the same impression to the vast majority of people, everybody would agree as to the correct names of colours, and the varying shades of colour would give the same sensation to practically all.

It reminds me of my visit to Messrs, Barr's stand at the Penzance Spring Show almost xactly a year ago. I was attracted by a lelightful little Jonquil that had, until then, scaped me, named Odorous Orange Queen.

I had some doubts as to its supposed range colour, and I, with others, tried it gainst a variety of oranges, but failed to natch it. The colour was nearer to guineaold (which was proved by a plutocrat prolucing a spade guinea!), yet just missed hat. However, the point is that, having rdered some bulbs myself, I endeavoured to nterest a number of friends who had, unuckily, missed the show. But because I ould not make them visualise the actual olour there was nothing doing. They, like nyself, had been bitten too often by vague olour description to be had again, so both hey and Messrs. Barr suffered a loss.

Next week I hope to visit again Messrs. Barr's stand at another show, but this time shall go armed for the fray with the colour hart issued by Ernst Benary, of Germany. (How much nicer if it were Barr's own olour chart.)

PERCY E. CHAPPELL, MAJOR (retired).
Cornwall.

Feeding birds

I notice in "Answers to Queries" for arch 9th, one of your correspondents, M. I. Y.," inquires what food blackbirds ke best, and in the reply it states: "They ppreciate bacon rind cut into small pieces." hat, surely, is an error, as bacon rind is tal to all bird life. I have known turkeys, wls, and ducks killed in considerable numers until it was discovered by post mortem ey had been given bacon rind cut up in eir soft food. I have never known it given small birds, but if it is deadly to large it ust, surely, be very much more so to small rds, such as blackbirds and thrushes. If M. I. Y." will make a mash of bread and ushed Hemp seed he will find his pets come ain and again to his table.

Only this last week some fowls of one of r gardeners were found to be very ill. was discovered that bacon rind was the use, and they were only saved with diffilty.

COURTNEY PAGE.
Haywards Heath.

Fruit trees and birds

I have read the letters on fruit trees and ds with the interest and sympathy due to fellow gardener's trials, and I venture to ggest, from practical experience, that lack of suitable food is generally at the bottom of the trouble. Worms and grain are of little or no use to the tit family, who, when deprived of their natural insect diet, require oily food, such as Monkey Nuts, Cocoanuts, and fat or suet. A temporary larder stocked with this nourishing fare, *plus* the ever-necessary dish of water, will do much to prevent their depredations, which, as a correspondent remarks, are about the same, whether the winter is comparatively mild or exceptionally severe. Exactly, for whatever the weather, natural food for all kinds of birds is relatively scarce, and the aphis tribes, so specially dear to the tits, are entirely absent.

Tunbridge Wells. M. B. GASKOIN.

Calceolarias for greenhouse decoration

THE Calceolarias have so many different and diversified colours that certain people favour them for creating a beautiful display in the greenhouse or conservatory. Another important factor is they can be grown to perfection with very little or, practically, no artificial heat.

Calceolarias for the greenhouse

The very tall plants in the centre are those of Calceolaria Clibranii, grown from seed. The tallest plant measures: Height, 4 feet 8 inches; circumference, 13 feet. Grown by G. Booth

Having secured seed from a good reliable source, it is much easier and quicker to raise a good batch of plants than by propagation of cuttings. In preparing the seed pan, see that it is well drained. Fill up with good loam, leaf soil, and plenty of coarse sand, well mixed together to ensure porosity. Water the pan, and let it stand a few hours before finally sowing the seed. Then remove the pan to a cold frame and cover with a sheet of glass, keeping the frame closed until germination has taken place; the light must be increased gradually, as the little seedlings are rather delicate in their early stages.

In a short time the seedlings will have made sufficient progress to be handled, and should be pricked off a little distance apart, making certain that the centre of each plant is free, and not covered by any particles of soil. It is important that the young plants should be kept growing without a check, and they must be shaded when it is bright. A slight dewing over with a syringe about twice a day will be of great benefit and encourage them to grow more freely.

For the first potting I use small "60's," or 2-inch pots. Be careful to lift them with as much soil attached at the roots as possible, and pot moderately firm, after which they may be stood on a cool ash bottom, in a frame, close to the glass. This will suit them admirably till late in the autumn, when frosts appear, after which they would be better where a little heat can be afforded when necessary. Keep them as cool as possible, at a temperature of 45 degs. to 50 degs., for if warmer they soon develop Green Fly, and unless this is detected in time they become yellow and sickly. This can also be prevented by a slight fumigation at intervals.

Examine the plants at different times to see if they require a shift, as some will probably need potting before the others. Pot them on into 5-inch or 6-inch pots, using fibrous loam, leaf soil, a little wood ash, silver sand, and a dusting of soot. For large specimens I use 9-inch and 10-inch pots. When the receptacles are full of roots it is time to feed with liquid manure, soot water, and a good fertiliser.

I have grown Calceolaria Clibranii with the large-flowered variety (as seen in the centre of the illustration), the two together making a delightful contrast. To get a specimen plant of Clibranii, I grow on a second year, and resort to pinching several times to make them bushy.

An effort should be made to keep the flower stems erect, as some of them will attain as much as 4 feet in length, and the pots should be practically invisible with the foliage. When they have reached the flowering stage, I have arranged them with other subjects such as Trachelium cœruleum and Lilium lancifolium rubrum, the whole making a gorgeous display for some weeks.

G. BOOTH.

Organic manures

The article on "Organic manures," issue March 2nd, page 152, is certainly most interesting, and doubtless the advice will be readily sought by your readers.

We notice the article mentions a drawback in regard to shoddy manure, in that some qualities are lumpy. There should be no difficulty if the buyer insists on a quality that is free from such lumpy nature.

Again, if your correspondents who find a difficulty in working the wool manure well into the soil experimented with a grade of wool manure, say, of medium fibre character this difficulty would be very much reduced.

Though wool manure is largely used for its great physical and bacteriological value, as apart from its undoubted fertilising effect, and in that sense is not required to top-dress, yet grades of wool manure are available, and we are assured from numerous practical users of this grade that an application on growing garden crops applied reasonably early during the time of growth has had a marked effect. Naturally, this grade is in a finely divided state of physical division.

Regarding the use of wool manure on light, sandy soil, the use of a medium "fibred" grade might prevent "opening" the soil.

The beautiful Pæonia Cambessedesii in its native habitat on the sea cliffs of Majorca

Pæonia Cambessedesii in Ireland

By Lady Moore

IN Vol. L., No. 2595, of Gardening Illustrated dated December 1st, 1928, under the title of "A Vagabond in Majorca," there is a description of Mr. Cowley's search for "a rare plant, Pæonia Cambessedesii." It may interest readers of Gardening Illustrated to hear of a search for, and capture of, this Pæonia some years ago.

During the winter of 1896 Miss Frances A. Geoghegan, an Irishwoman well known to the gardening fraternity as a lover of plants and a successful collector and grower of them, spent some weeks with her brother on the island of Majorca. They were driving one day with a Spanish landowner, Señor de Cipre, and his wife, and he, knowing Miss Geoghegan's interest in plants, told her of a beautiful Pæony. He described it as having "a red flower," which he said grew in a place high up on some cliffs near—difficult to reach. He sent a man to help Miss Geoghegan and some roots were procured. She sent them to her sister, who lived at Enniskillen, Co. Fermanagh, where, in a very different climate to that of Majorca, they flourish. A piece was sent to Miss Geoghegan's garden on the Malahide estuary, Donabate, Co. Dublin. When it flowered she sent the flower to the Royal Botanic Garden, Glasnevin, and as it differed from any of the species of Pæonia at Glasnevin, of which there was, and is, a very complete collection, Sir Frederick Moore sent it to the Editor of the "Botanical Magazine." The figure can be seen in a volume which appeared in 1907, Bot. Mag. 8161, from plant collected by Miss Geoghegan in 1896.

Many "bits" of this beautiful Pæony were distributed by Miss Geoghegan, whose generosity with her plants makes her visitors wonder how she has anything left in her garden.

She also found some plants of Helleborus lividus in Majorca. The late Mr. Burbage thought them distinct, but unfortunately they died.

In May, 1926, during the great strike, the writer was at Euston station anxiously inquiring for news of a train bound for Holyhead, when a voice with a plaintive Cork accent, soft as the atmosphere of that county, called out, "Look here, what am I to do? Here I've got a large basketful of Pæonia Cambessedesii I've brought all the way from Majorca, d'ye see, and they're being destroyed on me in this place. You'll get home before me, that is if any of us ever get out of this place, d'ye see. You'd better take the Pæonies and mind them for me, d'ye see, and I'll give you the half of them." Two days later, at 7 a.m., encumbered with much luggage (without benefit of porters), considerably handicapped by a large beautifully-woven reed basket (the shape that formerly was used by carpenters to carry their tools) full of very shrivelled, dry roots of Pæonia Cambessedesii, the writer was struggling for a place in the first train which had started for Holyhead for some days, when a gentle voice from a carriage window said sympathetically, "I am sure there are plants in that great basket." It was Miss Geoghegan who spoke—the reply surprised her. "It is full of roots of your Pæony, collected three weeks ago in Majorca."

During a journey which began at 8 a.m. and lasted until 11 p.m., for 12 hours the basketful of Pæonies reposed comfortably on the luggage rack, simply because not even the youngest passenger in that packed train could be accommodated there.

Although very much dried up, every piece of Pæony grew, and one plant flowered in this garden on February 21st. It has been protected by a cap-glass from two falls of snow, and 10, 9, 7, and 9 degs. of frost. It is still fresh and fair on March 2nd.

The grey metallic sheen of the upper side of the leaves contrasts beautifully with the clear Rose-pink flowers, and when the wind stirs the leaves the rich red of the underside is very attractive.

It has been stated that Pæonia Cambessedesii does not produce fertile seed.

In Miss Geoghegan's garden, in the Royal Botanic Garden, Glasnevin, and in this garden seeds of it have germinated freely, and the offspring have come true to type.

At the request of "The Vagabond" the names of the district where the Pæony was found on both occasions are not given.

Phylis Moore.

Willbrook, Co. Dublin.

Rock gardens at Chelsea Show

The letters on mountain limestone for rock gardens have been interesting, though no very illuminating.

If by rock garden is meant the old fashioned rockery in which the principa item was the stone and the existence of a few Ferns, Arabis and Aubrietia only o second consideration, weathered mountai limestone from Westmoreland, Yorkshire Cheddar, Wales, or Ireland is eminentl suitable.

If, however, an Alpine garden is meant this limestone is probably the least suitabl of any stone, for the following reasons:—

(1) It is a rock that does not lend itsel to small Alpine gardens, *i.e.,* under a least ¼ acre, as its massiveness is out c proportion.

(2) It requires the very greatest skil an artistic eye and a greater knowledg of physical geology than is possessed b the average landscape gardener to la so as not to produce an atrocity quit contrary to Nature.

(3) It does not possess one of the chi objects of stone in Alpine gardens, viz to absorb surplus moisture during w periods and give this moisture back t the plant rootlets in dry seasons. Mou tain limestone will only absorb abo 2 per cent. of its volume of water, a that not readily, whereas most oth limestones, as well as sandstones, a sorb from 8 to 30 per cent. of the volume, 12 per cent. being a comm figure. These figures are based c actual tests on over 50 specimens rocks, chiefly limestone. (A porosity 8 per cent. gives an absorption of gallon per cubic foot.)

(3a) The lack of porosity retards, if does not actually prevent, the growth vegetation on the stone itself, and t stone therefore retains its stark nake ness for years.

Mr. Dillistone seems to suggest that t only beautiful stone in North Wales is mou tain limestone. If he will refer to a ge logical map he will find that this rock cove only a very small area of North Wales.

When there is hardly a district in Engla or Wales in which natural stone more su able both from a horticultural and æsthe point of view is practically on one's doorste the craze for getting mountain limesto from the furthest distance is remarkable.

I recently saw a case in which mountain mestone had been brought something like oo miles from Yorkshire when it could have een obtained about 90 miles away, and that a district from which 20 to 30 different uitable rocks could have been obtained rithin 50 miles. In this rockwork (or lpine garden), constructed by a professional, nost of the rocks had been laid in a position uite contrary to Nature.

Where natural stone is not readily availble large furnace clinkers can often be obained, and though in themselves not beautiul, can rapidly be covered by plants clinkers are not out of place, as being very imilar to the natural " clinkers " in volcanic istricts and of the fact that plants thrive mong or on them I have definite proof), and ven concrete made on the spot of gravel is ot to be despised if used intelligently.

Surely, except on big estates where, by the ormation of gorges, waterfalls, etc., the eneral " landscape " of the garden is improved, the object of rockwork is primarily render possible, or at least facilitate, the rowth of that most beautiful and interestng group of plants generally classed as lpines. M. ODLING.

Marton-in-Cleveland, Yorks.

Cyclamen libanoticum

THIS beautiful species is unfortunately another instance of the almost general rule that those species with largest owers are the least hardy of the genus. C. ersicum heads the list for size and colour ombined with the craving for sun worship at its specific name suggests for, consider-g that it is not found in Persia, we must y to find some ground for Miller's name.

C. libanoticum with the next largest owers has not fulfilled the reputation for ardiness with which its introducer credited when he wrote in 1899, " possessg the vigour and hardiness of such species europeum, Coum and neapolitanum."

It was found in the Lebanon near Beyout, growing among C. ibericum and percum, at an altitude of from 2,400 feet to ooo feet. The tubers were deeply embedded nong rocks and the roots of trees and rubs. Evidently in well sheltered positions, fficult to imitate in a garden. The only ant I have succeeded in keeping alive for y length of time in the open, has grown r some twenty years in the driest spot in e rock garden, on a steep slope facing uth, and overhung by the outermost boughs an ancient Thorn. Every season when the st really warm spell arrives towards the d of May, the leaves of this Cyclamen are on frizzled up; and the thick foliage of e Thorn keeps off the rain till the fall of e leaf allows it to patter through the twigs. 1921 seed was ripened and a few self-sown ungsters appeared that autumn. This ecious harvest of that devastating, fiery mmer was carefully nursed on in pots, and o of the tubers now planted out in the ost-free house provided the blossoms for the companying drawing. Their size and gour compared with that of their long sufring parent, show that this species is tter suited for the alpine house than the en ground in ordinary gardens.

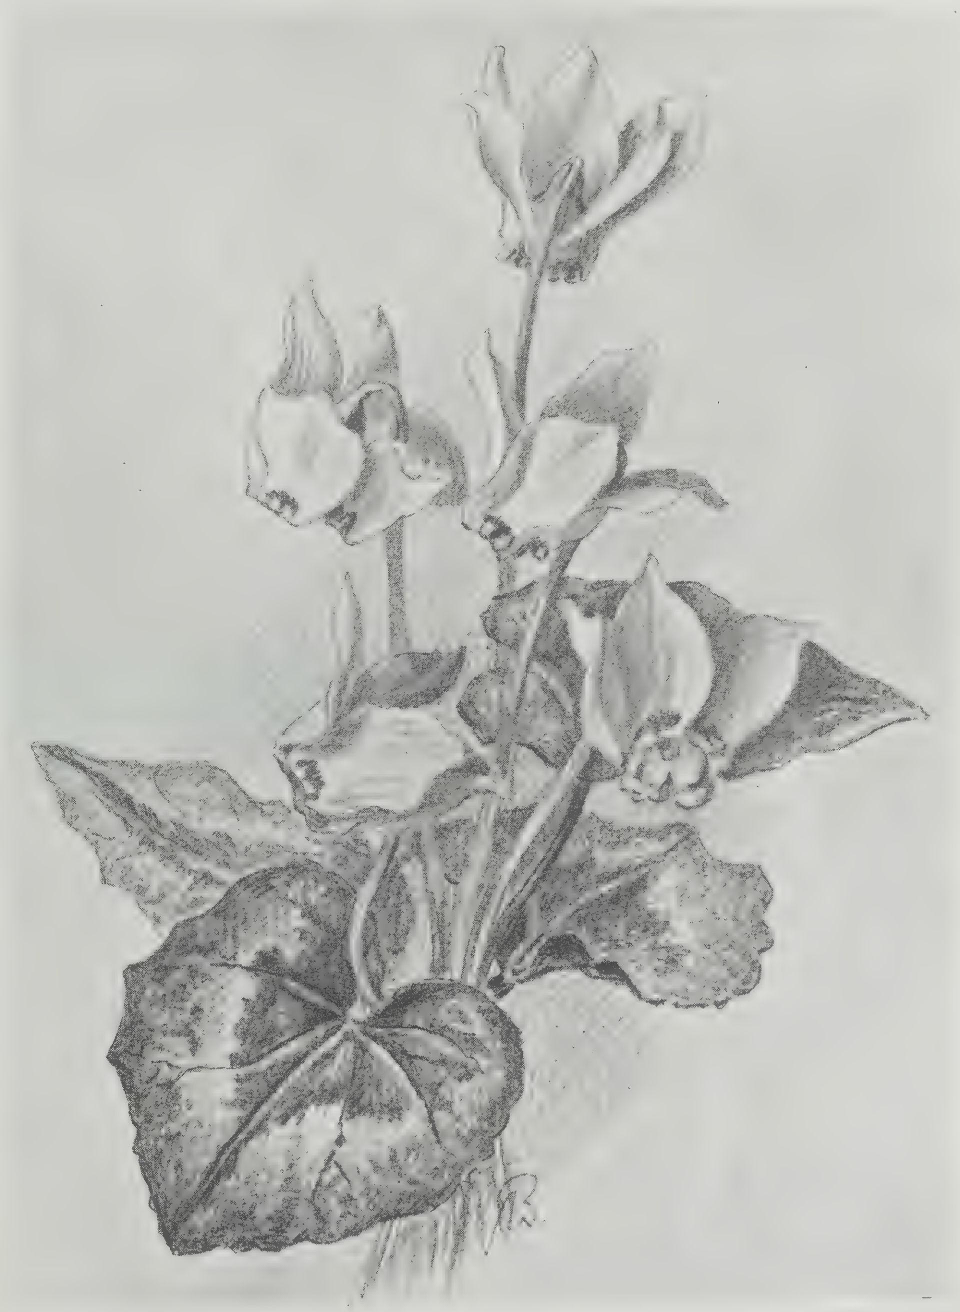
I saw self-sown plants at La Selva, Mr. oodall's garden near Nice, last March. ey were very strong and happy on a bank der trees. Doubtless in that land of sunine, as on their native Lebanon, they do st in half shade, but here they need full nshine, just as Iris unguicularis, a denizen hedge banks and groves in Algiers and ar Athens, cannot be over roasted here in gland.

. libanoticum has a great deal of charter and beauty in both form and colour. The breadth of the open throat catches the eye at a glance. It is due to the width of the base of each petal and reminds one a little of the form of C. europeum. The brilliant crimson markings are shaped somewhat like a capital M, or the joined couple of half circles with which a child ornaments the sky above the square house of his earliest efforts and calls pigeons.

These markings are set in a patch of white which shades upwards into a peculiarly charming shell pink, with less of blue in it than in any other Cyclamen I have seen.

I noticed one plant at La Selva with flowers of the persicum size and shape, but with the exquisite colouring of libanoticum which, I feel sure, is a hybrid, and a hint from Dame Nature for the raising of a beautiful and refined race.

It is quite likely that in more sheltered gardens where C. africanum is a success in the open, C. libanoticum might colonise and reproduce the autumnal charms of C. neapolitanum in the early spring. I much hope that any who grow it well will tell of their success. E. A. BOWLES.



From a drawing by E. A. Bowles

Cyclamen libanoticum

Wisley trials

The Director of Wisley begs to remind raisers of Roses that six plants of each variety for the Rose trials at the R.H.S. Gardens should reach him at the R.H.S. Gardens, Wisley, Ripley, Surrey (railway station, Horsley, Southern Railway), by the end of March. Each variety requires an entry form, copies of which will be sent on application to the Director.

The British Gladiolus Society

The dates of this Society's 1929 exhibitions are:—August 13th—London Show at R.H.S. Hall. August 28th, 29th, and 30th—Main exhibition at Southport in conjunction with the Southport Flower Show.

The Gardens at Norsebury, Sutton Scotney, Hants

By Geo. Dillistone

If one could choose the site for a house according to its desirability for making a garden what a pleasant world it would be—for gardeners. As this is rarely possible, it remains for the gardener to make the best job he can of what is left to him by the builder. The problem that usually confronts him is to conceive the sort of garden that suits the house, and sometimes of arriving at a satisfactory conclusion as to how to fit the particular arrangement of garden that seems most desirable into the situation.

Norsebury, Sutton Scotney, Hants, the home of Mr. J. Sutcliffe-Pyman, is one of those country houses that has been designed, and the site of which has been chosen, with a fine regard for its potentialities for the development of a certain type of garden.

The herbaceous borders at Norsebury, Sutton Scotney, Hants.

The house is rather severe in feeling, of the style described as Queen Anne. It is one of those houses that should always look towards a landscape, but be set in formal and geometrical lines in its immediate surroundings. To achieve this on sloping ground one has to terrace outwards and create a series of ever-broadening level garden areas. Sometimes a tree, such as the Cedar that appears in the second illustration, comes in the way of such levelling, and if, as in this case, it is important enough and attractive enough to deserve it, then it is better to raise or lower the general level of the terrace on which it stands rather than risk injury to an incident in the general composition that can make, and its absence mar, the picture.

Where trees are scarce those that do exist become important, and it is worth while going to considerable expense and trouble to preserve even one. It is, however, possible to make a fetish of this respect for trees. I am constantly coming across people who are appalled at the idea of removing any tree, even a dead one. Not because it possesses any particular attraction in itself, nor because it strikes a pleasing note in the composition of the picture, but because—well, just because it is a tree and has taken a long time to grow.

Make the most of your trees, respect them, worship them if you will, but remember as you pray to them, if you are praying for real beauty in your surroundings, they may on occasion be false gods, and can obstruct the development of the very beauty you so ardently desire. If they can give you more (or even as much) æsthetic enjoyment than their removal permits you to develop keep them by all means. Often, however, it is merely a matter of them being in the wrong place. No one objects more strongly than I do to the wholesale slaughtering of fine trees, but the preservation of even worn-out and dying specimens is often carried to extreme lengths. I have known people who would ruthlessly insist on the removal of anything human or animal that offended their sense of the fitness of things tolerate a dying tree and endow it with a regard that a moment's thought should convince them was entirely misplaced. Such people shudder at the sight of a war tragedy, but regard the pathetic remnants of an almost limbless tree as something that is beautiful and picturesque when, and because, it is really decrepit.

At Norsebury the Cedar was so emphatic a note that it was worthy of all the care bestowed upon it.

The gardens are, as a whole, an example of development on straight lines. It could have been otherwise, but there is a sense of congruity in the association of house and garden that justifies even this extremely rigid development. In the early days such gardens are ugly, and give the impression of long-legged puppies whose bodies are out of all proportion with their supports.

Time remedies this, and as the vegetation matures the very simplicity of the lines at
a dignity and importance that a more
formal treatment of such a site and aro
such a house would never achieve. In
early days, too, there is a feeling of gar
ing in compartments. It is so obvious
each portion has been fenced off from
others and the series of rectangles bec
positively monotonous. Later, when
fences have matured and thickened t
steals into such gardens that sense
seclusion that is so desirable an attribut
the English garden which the transition f
one enclosure to another serves but to
phasise. After all, as the founder of Gar
ing Illustrated has pointed out, althoug
may sometimes be necessary to *plan* the
den on formal lines, formality in *plantin*
never necessary. Norsebury is young yet.
will grow, and will ultimately spread i
out on freer and less rigid lines, and m
itself pleasingly into the beautiful lands
in which it stands. It is long past the
puppy stage, and with the care and atten
that is being bestowed upon it, is well on
way to becoming that delightful combin
of Art and Nature that makes the En
garden the best in the world.

Campanula persicifolia Moerhe

This is a beautiful plant, the flowers
pended on straight, stiff stems, each
18 inches to 2 feet in height. The flov
which are pure white and semi-double,
produced in great abundance. It succee
rich, warm soils in any position, and l
well when associated with Delphiniums.
of the prettiest sights I have ever seen
an avenue some 100 yards long forme
clumps of Delphiniums at intervals of a
2 yards. In the spaces thus formed
Campanula was planted. The plant g
quickly, and soon forms large tufts w
require dividing every second year at l
in fact, every year in some districts shou
the rule. Cuttings may be rooted in the
ground. There should be plenty of su
basal growth for this purpose without i
ing the general appearance of the plant.

JUBILEE CELE

Contributio

From the Viscountess Byng of Vimy.

All good wishes to Gardening Illustrated on its birthday. May it long continue to interest and instruct amateurs like myself, who enjoy and appreciate its worth to the fullest extent. Evelyn Byng of Vimy.

Iris sibirica hæmatophylla

Many years ago I had in the garden at Clifton Cottage, York, a plant which really deserved the above name. The flower—not conspicuous for size or colour—was much like that of an ordinary Sibirica, but the leaves were of a darkish red; that is to say, blood-coloured. I flowered it, but eventually lost it. I have never seen it since, nor have I been able to hear of it. My plant, I think, like so many other garden treasures, was due to the generosity of Sir Michael Foster. I should be very glad to possess it again. I am aware that there is a variety of the same name in trade lists, but its foliage is not blood-coloured. G. Yeld.

Orleton, Gerrards Cross.

Fruit of super excellence

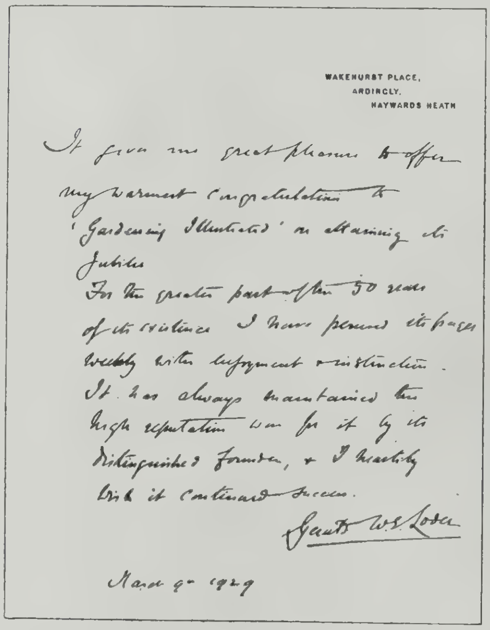
As everybody knows, there are exceptional seasons when fruit is of extra good quality all round. This phenomenon occurs in every climate. Though all fruit may be included in such a season there are always one, two, or more varieties which are exceptionally good. To find, however, all varieties of superexcellence is exceptionally rare. At the Norwich Chrysanthemum Show held November 22nd to 24th, 1928, when all East Anglian fruit was represented in exceptionally fine condition, the Norfolk-grown fruit broke all records in size, shape, weight, beauty of form, and colouring, both trade and amateur.

Take, for example, Pears Doyenné du Comice, Emile d'Heyst, and Louise Bonne of Jersey. These were gigantic in size, yet typically perfect in shape, with a fullness and super-added beauty impossible to believe without being actually seen. The weight, the condition of maturity, and the colour so mellow and typical of perfection. While all the fruit from the whole of East Anglia showed these qualities, it was the fruit grown in Norfolk that completely eclipsed everything else. Norfolk does, and always has, grown the finest fruit in the kingdom, but never anything like this.

Lord Suffield's head gardener had among his exhibit the two best bunches each of Muscat of Alexandria and Gros Colmar Grapes exhibited in 1928. These were superb samples of culture, without a single point at fault. England can grow Grapes. It is a pity they were not shown at the R.H.S. Hall.

For fruit from a farm run purely on commercial lines this was the finest exhibit put up that I can remember, which shows that the older hands of the Victorian era were, and still are, the best exponents of fruit culture. It is appropriate that such a very rare occurrence should not go unrecorded, especially in the Jubilee number of Gardening Illustrated. C. A. Jardine.

From Mr. Gerald W. E. Loder, President of the Royal Horticultural Society :—



WAKEHURST PLACE,
ARDINGLY,
HAYWARDS HEATH

It gives me great pleasure to offer my warmest congratulations to 'Gardening Illustrated' on attaining its Jubilee.
For the greater part of the 50 years of its existence I have perused its pages weekly with enjoyment & instruction. It has always maintained the high reputation won for it by its distinguished Founder, & I heartily wish it continued success.

Gerald W. E. Loder

March 9th 1929

A great achievement

One Friday in March, 1879, I was standing before a railway bookstall when my eyes caught an advertisement which had been written roughly with blue pencil by an enterprising manager: "*See the new gardening weekly, out to-day—'Gardening Illustrated,' One penny.*" Some of the papers had been displayed rather prominently, and there was also a large pile of copies on the stall. By 6 o'clock that night they had all gone. That was how the first penny gardening paper was received in one of our busy midland towns, and it was a criterion of the way this paper was acclaimed all over the country!

I showed my copy to some friends, who saw to it that they were supplied the following week, and they became regular readers. Gardening Illustrated was the pioneer of the cheap weekly journals devoted to horticulture, and its inception was hailed with delight by hosts of amateur gardeners. Up to that time advice on gardening matters had to be sought from papers costing sixpence per week, and was directed mainly to professional gardeners, or those owning large establishments. This information had little or no interest for the small gardener, as many of the articles were too advanced and too long.
What the one with a small or moderate-
garden wanted was a paper that woul
him, without ambiguity, what and ho
sow and plant, and when to do it.
William Robinson, then the Editor of "
Garden," saw that the time was ripe fo
introduction of such a paper for garden l
at a popular price, and so he brought
being Gardening Illustrated. In those
off days there were those who looked
this piece of enterprise as a great adve
attended by no little risk. "Just fancy
remember someone remarking to me,
gardening paper for a penny a week."
Mr. Robinson had courage and faith en
to believe that he was justified in his
mistic outlook, and results proved that he
right in his farsightedness.

For some little time, if my memory doe
deceive me, Mr. Robinson personally
ducted the new paper. Later on it
under the Editorship of the late Mr. W
Thomson, who worthily filled the offic
24 years, and who combined dual qualiti
good gardener and capable editor. At a
like this one cannot help thinking of
many writers who contributed to its colu
during the half-century of its existence
have passed away, men like S. W.
herbert, E. H. Jenkins, W. Iggulden, E
Molyneux (of early-day Chrysanthe
fame), Rev. J. Jacob, and quite rec
James Mayne, whose death I was sor
see announced.

Gardening Illustrated has had its
and downs, and has changed hands on se
occasions since its first year. I ventu
submit that I am expressing the wish
old readers and contributors alike when
that we were pleased when the present
of Benn Bros. purchased it some years s
To them, as well as to its Editor,
Herbert Cowley, who worthily keeps the
flying of the old paper, I would tende
congratulations on the attainment o
Jubilee, and express my best wishes f
future prosperity. Leahur

The advent of "Gardening Illustra

Fifty years ago only well-to-do am
and professional gardeners and th
traders indulged in the luxury of a ga
ing paper. The advent of Gardening I
trated effected a great change. It was
lished at one penny, and thousands of g
lovers of very moderate means rejoiced i
fact that they could obtain a good gard
paper so cheaply, and they were more
pleased when they saw that they coul
advice free of charge. Gardening I
trated reached the masses in a way th
other paper had done. Answers to c
spondents have always been an impo
feature of this paper, and garden owners
may be in any difficulty should apply.
traders were not slow in recognising th

G. J.

Fifty years a gardener

There could be no greater testimony to the changes in gardening during the last half-century than the fact that it is possible to have a well stocked flower garden without including any species or variety of plant, bulb, or shrub that was generally known 50 years ago. A century ago or thereabouts there were only three varieties of Sweet Peas—the bicolour purple, the pink and white, and another—and at the time of which I write there were probably not many times this number in commerce.

As to Roses, La France was just becoming common, having been introduced in 1867 as the first Hybrid Tea. The Rose growers used to have a fine show at Midsummer, and for two or three weeks after, but few autumn Roses as we know them. What they had were scented, except Baroness Rothschild. They had to rely upon Hybrid Perpetuals and Teas for bushes and standards. Looking through a catalogue, I see only four non-climbers that were grown then—General Jacqueminot, A. K. Williams, Prince Camille de Rohan, and Charles Lefebvre. But Gloire de Dijon was grown as a standard, and that and Marèchal Niel were the most popular climbers. Ramblers of the Polyantha and Wichuraiana type were unknown, but there were many climbing varieties.

Of our most common flowers to-day, Violas had not come into vogue, if known at all, though Pansies were almost a cult with many real florists. Dahlias were seldom seen, and then, of course, only the incurved varieties, and Chrysanthemums out-doors were still dependent upon an exceptionally genial autumn. And so one might go on with Narcissus, Delphiniums, Chinese Pæonies, etc.

Laurel of ancient days: Laurus nobilis

But I miss the fine majestic Antirrhinums, 3 feet to 4 feet high, with spikes and flowers in proportion.

It is not only the things we did without, and did well, as we thought. An even greater difference was that of taste and fashion. Perennials were mainly grown in cottage gardens and in the less prominent parts of the larger gardens. (I speak of my own locality, for we did not go far outside it.) It was the time of bedding out, rainbow borders, and carpet bedding, most of the garden being planted out in late May and early June, and garden functions in consequence did not generally begin until the middle of July. Geraniums (Pelargonium zonale), with variously-coloured foliage, yellow Calceolarias, Ageratum, blue Lobelias, Heliotrope, Cannas, and Fuchsias, with tender and half hardy annuals like Petunias, French and African Marigolds, Verbenas, Balsams, Stocks, and Asters, were the most usual subjects for bedding out, carpet bedding having its own special dwarf kinds of plants, mainly foliage, not greatly different from those to be seen in public gardens to-day. Annuals sown where they were to bloom were used with good effect by the majority who had no glass for bringing on the multitude of tender and half hardy plants required by the bedding-out system, and though there were no Shirley Poppies, I can remember blazing masses of Nasturtiums, Eschscholtzias, Godetias, red Flax, and Malopes, with no less beautiful displays of the quieter annual Chrysanthemums, Collinsia, and Clarkia.

Daffodils by the path

Few knew the names of any Apples or Pears except Ribstons, Codlings, Blenheims, Russets, Warwickshire Pippins, and Nonpareils, with Williams, Bergamots, Jargonelles, and Catillacs, or Iron Pears, as they called them. Cox's Orange was raised nearly a century ago, but was apparently unknown, while Bramleys, Newtons, Bismarcks, and many others of our most popular varieties did not exist, or were not in commerce.

In conclusion, I think the greatest change of all is in the life of the people. When I first went to an office in London I believe I was almost the only gardener amongst some 200 men. Now the majority of men of mature years have a garden and work in it. Not only is it a healthier recreation than many, but it gives pleasure to others, and increases the wealth of the country. SENEX.

Progress of British horticulture

Looking backward is sometimes profitable and always interesting, and the many changes in gardening which have taken place, the best of which GARDENING ILLUSTRATED has advocated, reveal the great progress of British horticulture. Show and fancy Dahlias were in vogue, and very fine in their own way they were. The writer grew a good number of these. Then, the single Dahlia began to make its appearance. The singles, White Queen and Paragon, were cultivated alternatively with a double scarlet decorative one called Glare of the Garden. Then the first of the Cactus varieties, Juarezii, was introduced, but had to make room in course of time for new Cactus varieties, which were not so tall and did not hide their flowers so much as Juarezii. In the same garden tuberous Begonias were bedded out, but they were poor indeed compared with the superb flowers we have at the present day. Show and fancy Pansies were greatly appreciated, and the Antirrhinum, now such a favourite, was mainly represented by the varieties with striped flowers, which were most popular for exhibition. Pentstemons and Phloxes were much cultivated. The old Scotch Rockets received much care, and a source of great discussion at shows was the quality of the French and, in a lesser degree, the African Marigold. Where hardy plants were cultivated, the number of varieties was but limited. Delphiniums had not reached the stage of perfection they have now attained, and the now popular Lupin was represented by the old blue L. polyphyllus, the bicolour, and the white variety. Aconitums were very limited in their variety. The Pyrethrum was making its way rapidly, and the double Potentillas, now rather neglected, were much cultivated in good gardens. The double forms of Anemone coronaria were the pride of the florist, but the informal St. Brigid varieties had not yet come into their own.

Anemone japonica had for its representatives the type, Honorine Joubert and rosea, but was not generally grown. Few varieties of the border Carnation were to be had; and the old Malmaison nearly monopolised the space for these under glass. The queenly Rose had many lovers, but the choice was but small compared with what we have now. H.P.'s and some Tea Roses, and some of the old favourites and climbers of the Ayrshire type, had to satisfy the lovers of this sovereign flower. Its so-called rival, the Lily, was largely represented by L. candidum, and many made great efforts in vain to succeed permanently with L. auratum, L. chalcedonicum, and L. testaceum seemed more plentiful than now; but, of course, a number of other beauties had not come into cultivation.

Looking backward, too, we appreciate the wealth of shrubs which have been introduced in recent years. One might wander on speaking of the changes in flowers of the open garden. Under glass, the principal changes have been in the neglect of specimen plants, which used to be the pride of the gardener. Much has been written also in disparagement of the Grapes of the present day, but I am not prepared to assert that the general standard of fruit growing under glass has depreciated. In the small garden the scope of the work of the gardener has been immensely increased, but, given time and facilities, I believe that he of the present day can, and does, grow Grapes, Peaches, and other fruits equal, if not superior, to the practician of fifty years ago. The same may be said of outdoor fruit and vegetables. There are reminiscent visits to Kew, Edinburgh, Glasnevin, and other botanic gardens; shows, such as the old Temple ones, Chelsea, Edinburgh, Dublin, and many other places. There are memories of such departed gardeners as Professor Bayley Balfour, W. B. Boyd (of Faldonside), James Allen, James Grieve, Mr. F. W. Burbidge (than whom one had not finer friend), Robert Lindsay (of the Edinburgh Botanic Gardens), Bruce Findlay, James Whitton, the late Rev. C. Wolley-Dod (a giant among hardy plantsmen of his time), that ardent flower lover, W. E. Gumbleton, who hid behind a caustic exterior the kindest of hearts and the greatest courtesy, besides many who are still with us, and whose friendship it is a happiness to have. S. ARNOTT.

Dumfries.

A DAY WITH THE FOUNDER

UR host is seated by a spacious Tudor fireplace where giant Pine logs are blazing cheerfully in the afternoon of a y January day. He occupies an invalid's r—has done these 20 years—but there is ing of the invalid in his faculties of mind, t, voice, and hearing. With surprise we that he is in his 91st year, and he must ly be one of the most wonderful old men g. We have noticed on our way in the ing portrait of him by Duran, showing a dark, upright, and arresting figure of a ant personality in the prime of manhood, a moment later, passing sprays of Garrya tica in the hall and a table bowl contain- Hamamelis, Iris stylosa, and Snowdrops, are in the presence of the original Wm. inson, now mellowed by the years into a -haired, benign gentleman, who receives with the charm and courtesy of an age to most of us is not even a memory.

e has been perusing a budget of the early logues, and expresses his regret at the ine of many fine old nurseries—the ls', Ley's, Frasers', Williams', and rs, and especially of those in London ch the builders have ejected. We remind of the many readers and others of his old ciates who so frequently inquire of him, he is obviously touched by the fact that personality and work are so gratefully embered. He then pays his own tribute he industry and loyalty of W. P. Thom- , who succeeded him as Editor of GARDEN- ILLUSTRATED. We are delighted to hear he pleasure the founder still derives from paper, and he smiles at the recollection ts beginnings, also of the mild sensation it sed. He volunteers to write the story for lication in these pages. Of writing he s but little now, but we were very inter- d to hear that a new edition of "The d Garden" is to appear shortly with new still more beautiful illustrations. Fine d-made paper and good printing are first ciples with him, and he criticises the ghty clay papers of the day which impart ndage to a book without necessarily add- to its quality.

eading is, perhaps, his chief indoor re- tion, and he gets through a good deal of on. Discussing this, he has a dig at the bidity of Hardy and the copiousness of nett. Ruskin has many detractors adays, but he certainly has a devotee in host. He is a great lover and collector ictures, and there is much on his walls would grace a national collection. Of canvases of Mark Fisher, originally a rait painter, who became a great land- e artist, he speaks with particular affec- . Fantin-Latour, of whose work he has y examples, he regards as the greatest of floral painters. Moon, whose art he sed considerably in his publishing days, praises for his faithful delineation of er-form and colour. He speaks glow- y, too, of that great artist and illustrator f is books, Alfred Parsons. The exhibition f Dutch Art at the Royal Academy inter- d him very much, and he had made the aintance of many of the subjects on his ts to Holland.

f the "pictures—that is, the movies—he no experience and little interest in them, the wireless gives him entertainment, fly by its talks, and its music of the pre- period.

e argued that we have all the material fine picture dramas in this country, and n we spoke of California's advantage in inosity for the purposes of film photo- hy he was reminded of his own visit as ery young man to that country, and the book he wrote upon it. There is nothing in the world like our home landscapes, he said, proudly, and, we might add, few Englishmen know that truth more profoundly.

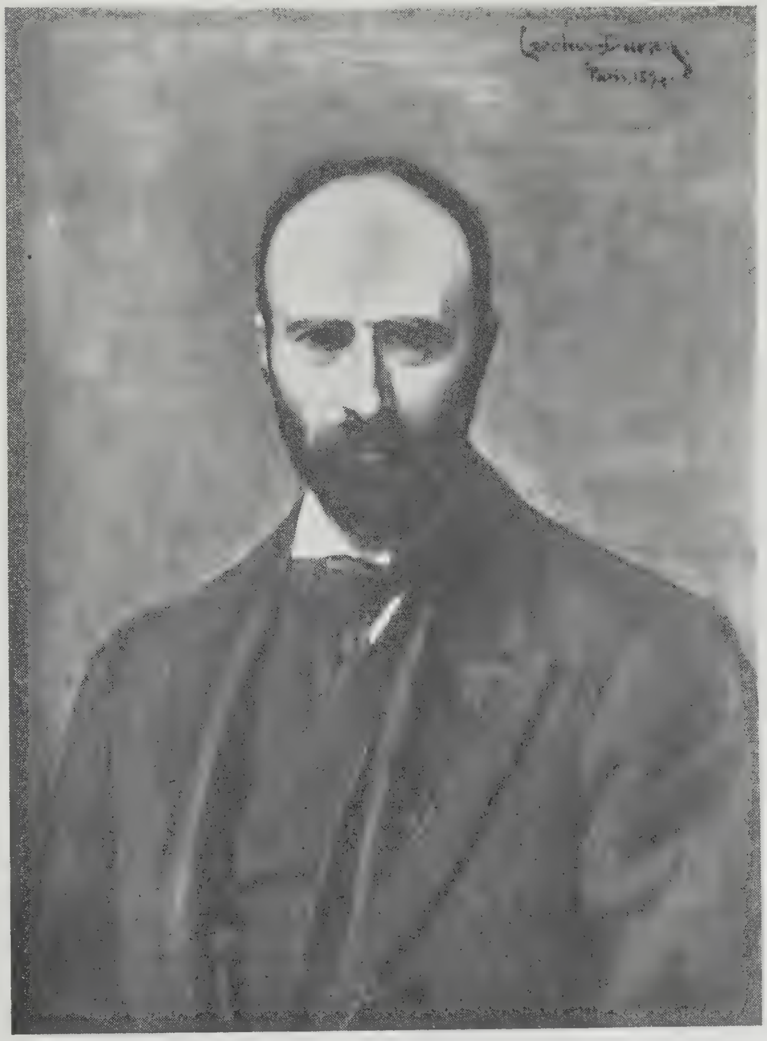
Certainly there is nothing to resemble the gardens and estate of Gravetye. Here can be seen in perfect consummation the ideals so consistently upheld in his many books and in this journal. We had the merest glimpses of his genius in an all too brief tour with his gardener, Mr. Markham, and was there ever a better understanding between a man and his gardener-interpreter as between this pair?

The gardens in January but faintly foreshadow the glory of succeeding foliage, flowers, and fruit. Numerous berried shrubs, especially Berberis in variety, were noted, and several of the Witch Hazels were flowering. The Heath garden, however, held one thing for us in its fullest beauty, that of Erica lusitanica in spires, shoulder high, of limpid green foliage and trusses of delicious white blossom. This fine Portuguese Heath had been in flower since October, and is a shining light of purity and cheer for the dullest days. Erica australis, probably the finest Heath of all, is nearby and will be flowering at its best in May. Walking over the grassy slopes we are reminded that soon these will be a stream of naturalised Snowdrops, Daffodils, and other spring bulbs.

The fruit garden is a thing of wonder—a huge circular enclosure within lofty stone walls—and the effect of these when adorned with the blossom of countless trained and double-cropping trees must be magnificent. Many fine old bushes planted here give promise of the riot of russet, ruby, and golden fruit to come. A robust Wistaria entwines a seat and shelter, and flowers twice a year. Standard fruit trees are so prolific that many trees are sacrificed as supports for these lovely climbers, whose coiling strands have become practically one flesh with their hosts, and Clematises entwine many others. In Wm. Robinson's early days comparatively few varieties of Pear were cultivated to any extent in England. Obtaining from France and elsewhere Pears with larger fruits, he has proved that some of the finest fruit we should otherwise have missed can be successfully grown in this country. On the outer side of the enclosure are a series of lateral walls forming sun traps for the cultivation of Peaches, Apricots, Figs, and other fruit.

Until clothed in the beauty of Roses and various climbers the pergolas stand in monastic grandeur and simplicity, and their shady Lichen-covered pillars and walls, and paving-stones of Old Newgate will call to us in the hot days of summer, when we tramp the sun-baked pavements of London.

A smuggler's lane that formerly led from Lewes ended in the grounds in a deep pit which, now filled with tons of loam, is a corner for Magnolias.



Reproduced from a painting by Carolus Duran, 1874

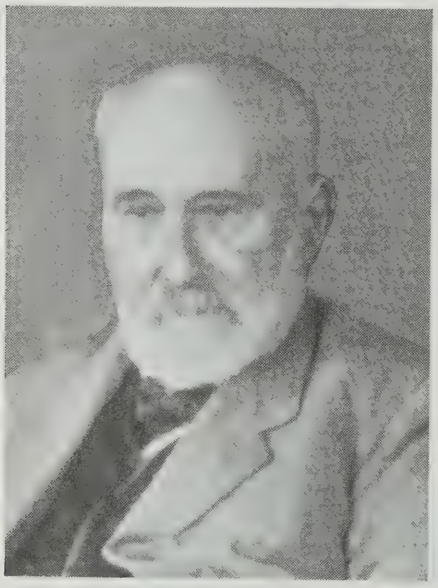
William Robinson, the founder of "Gardening Illustrated"

A wood of Corsican Pines which Wm. Robinson planted as young plants, no bigger than Groundsel, when he first came to the wilderness and sixteenth century derelict manor house that was Gravetye, now stand out like giant protectors of it, and in the midst of these are 70-foot specimens of Abies grandis, which form a landmark for many miles around.

These Pines were thinned out in war time for use as pit props, and are still growing so thickly as to need thinning once more.

A fine stretch of lawn bordered with profusely vegetated walls on either side and a trellis of climbing plants is known as the playground. It is little used for games now, but one day last summer, when a number of children arrayed as flowers were dancing there, Wm. Robinson, innocent of what was going on, was wheeled up, and his delight in these festivities, of which he at once became the hub, was unmistakable, and gave pleasure to everyone.

He is still inexorable on the subjects of topiary and garden "ornaments," and he expresses himself vehemently on these, to him, alien attributes of the English garden. We admired the natural ornament to which he has subjected a porch with its roof hidden beneath and beautified by a drapery of warm-tinted Sedums.



William Robinson
From a recent photograph

The gardener's fine old timbered and moated house, older than the manor itself, is in a delightfully picturesque setting. Colour this bleak day was provided by yellow Jasmine on the walls, a cheerful hedge of Pernettyas, and a prize lot of chickens. The grassy banks of the disused moat will be a mass of Daffodils by this time, and alongside is the now empty bed of a large lake soon to be filled with flowering shrubs in great variety—a treat in store for our next visit. The stream which feeds Gravetye's large lake teeming with fish and with countless Nymphæas on its bosom flows through this garden.

We share tea and further reminiscence with our host, and then his car is in attendance for our journey to the station. We feel that we may have tired him a little by this long discourse, but there is no trace of this as farewells are said; he only expresses eagerness that we should come again to see the full glory of Gravetye in the spring and summer time. The logs blaze and crackle as we go, leaving him to his dreams of the past. He is not living in the past, however, and every fine day "W. R." is about the garden in his chair, or over the estate in his "caterpillar" car, still taking the keenest interest in the work of his large staff. The fires of his genius burn steadily as he plans
schemes of the next 10 years' reconstru
and perfection of this paradisal fastne
the Sussex hills.

Progress in the Cultivation of Orchids

THE first half of the last century might be termed the childhood of the Orchid cult. A few species had been introduced and grown previously, but their needs were so little understood that the plants known were regarded as quite outside the scope of the average garden and gardener. The latter half of the century saw a gradual but steady progression, and the last 50 years, particularly from 1870, has seen a wonderful increase, not only in the number of species grown, but, as their cultural requirements became better understood, by their inclusion into the greater number of gardens having greenhouse accommodation, and, particularly of late years, in their cultivation by amateurs who, possessing but one or two glasshouses, act as their own gardener and find in the Orchid an attractive and pleasurable hobby.

It must be nearly, or quite, 50 years ago when, as a schoolboy, I saw, to remember, an Orchid for the first time, a single bloom of the Dove Orchid (Peristeria elata). Its curious structure even then made an impression on me.

My next recollection—a decade later—is as a young gardener getting into hot water for allowing cold water from a syringe to fall on some plants of Cattleya Mossiæ, which were in full bloom. As a youngster the foreman should have warned me, but the head gardener synchronised at the moment and at once defined my crime to me—in full, with, to me, many quite unnecessary digressions and details.

Since then many Orchids have passed through my hands, but Peristeria elata and Cattleya Mossiæ still bring recollections.

From 1870 the rapid increase in Orchids was not only due to the enormous numbers imported, but to the attention given them by the hybridist. Previously only a few Cypripediums, Dendrobiums, Cattleyas and Lælio-Cattleyas, a hybrid between a Phaius and a Calanthe, and a few Calanthes, notably C. Veitchii, had been in commerce, but attention was given to practically all the showy species and genera, and to-day there are probably more hybrids than species grown.

A visit to one of the R.H.S. exhibitions will give some idea of the number of Cypripedium, Cattleya, Lælio-Cattleya, Odontoglossum, and Miltonia hybrids grown to-day and of their value for decoration.

In 1904 a great stride was made with Odontoglossums, a hybrid being evolved between O. Pescatorei (nobile) and Cochlioda Noezliana, with bright red flowers, a colour previously unknown in Odontoglossums. To-day Odontiodas are quite common, and as Orchid hybrids readily intercross with allied hybrids, forms are now obtained with nearly the size of the Odontoglossum flowers, and an intensity of colour quite outside the natural limits of that genus.

Possibly no other family of plants has received such attention from the hybridist, nor has given such varied, diverse, and useful results. Fortunately, some of the older species and hybrids are still in cultivation, and comparison can be made between, say, Cypripediums insigne, barbatum, villosum, and Spicerianum, and the broadly dorsalled, richly coloured forms which are continually being exhibited.

A further illustration may be given in Cymbidiums. The last 10 years has seen a complete revolution in this genus. The species Lowianum, Tracyanum, eburneum, Hookerianum, etc., are still occasionally seen, but the introduction of insigne wit
tall, erect spikes, has, through the hybr
given rise to a new race with tall, arc
spikes and flowers of varying tints
white to red.

Still the work goes on. The last 50
has seen decided progress, but finality is
yet reached. Just as years ago the
known species were the forerunners of
present-day hybrids, so in years to come
to be hoped they, in turn, will form the
of yet more decorative forms.

Thirty years ago no one could have
seen the height to which Cymbidiums
now reached. True, it needed the intro
tion of distinct species, such as insigne
erythrostylum, but it is very doubtful i
the showy Orchids have yet been discove
There are still localities in the world w
such plants may exist, and if not
hybridiser has still an enormous fiel
which to work.

A reference to Williams' Orchid Man
published in 1877, gives some 115 genera
about 1,000 species, varieties, and hybrid
being in cultivation, *i.e.*, in Orchid co
tions. Sander's Orchid hybrid list to
contains about 2,000 hybrids in Cypriped
alone.

Monsieur Aubriet: His flow

A note on a beloved flower first introd
into this country 220 years ago, and na
after a once well-known French bota
draughtsman, may not be out of place on
occasion, for if we except the Kabschia
frages it is hard to think of any occupa
the rock garden which has been so impr
and gone from glory to glory during the
time of GARDENING ILLUSTRATED as
Aubrietia. Of the ten or so original vari
from Southern Europe and the Levant
only, Leichtlini, perhaps itself a hybrid,
hold its own with the new large-flow
Aubrietias from which we may make
choice.

But to-day this paper may look bac
years to the so-called grotto, resplendent
white marble, broken statues, foun
(how well one can remember the decli
days of these pretentious abomination
otherwise blameless gardens), Ferns, F
without end, and Aubrietia; not
Aubrietias we delight in now, but the
Deltoidea and Tauricola, those plants w
are still offered on market stalls as "P
Rock Cress," a name which strikes
the more ambitious plant lover who kn
the glories of the new race.

As discerning ladies choose their col
from a thousand shades of the dyer's
only in a northern light, so Aubrietias, es
ally the mauves and purples, must be
in certain lights to be enjoyed to their
Go to your garden at sunset, when there
glow in the sky, such as delights sheph
and then will your banks of Aubrietias
sume those indescribable colours ran
from blue to fiery purple, which may we
the most wonderful mass colour effect ob
able in our gardens.

The last 25 years have brought m
hybrids, among the first and most notab
which were Moerheimii and Fire King,
now eclipsed by newer introductions, suc
Gloriosa and Rosea splendens. Among
older mauves and violets Prichard's A1,
Lloyd Edwards, and Dr. Mules still
their own, the first being Commended in

7 R.H.S. trials, where Carnival, of a rich ple-violet, received the Award of Merit, ether with Vindictive, described as "rich, ght, rosy-red, fading somewhat," a colour ich, to the wary, narrowly escapes genta. Both these varieties were raised Mr. Clarence Elliott, so we may be sure t the shade of M. Aubriet looks down on garden and smiles, while we, for our part, happy to live in that comparatively small t of the globe where one may enjoy the tivation of these glories.

tudland, the newest and best of the pale ender flowers, brings to mind another ilar plant with a history. In an out-of--way corner of Northamptonshire acres of orietia are planted. The grower owned a which, as faithful dogs are to lonely n, was his master's inseparable companion. Fate deprived the man of his comion, which was buried in a corner of the l of Aubrietias with a mound to mark the t. As the months passed, the master iced on the grave a seedling Aubrietia, ich in due time bore beautiful large ender flowers, distinctive from any that l ever grown there before, an In moriam to a faithful friend. . . .

o if any should happen upon Aubrietia elity he will treasure it for its history, l will, perhaps, remember the lines of the e old Omar of Naishapur:—

sometimes think that never blows so red
he Rose as where some buried Cæsar
bled;
hat every Hyacinth the garden wears
ropt in her lap from some once lovely
head."

F. H. F.

Memories of Chiswick

As an old friend and a contributor of some long standing to the pages of GARDENING ILLUSTRATED may I be permitted to offer both the Proprietors and its Editor my sincere congratulations on this auspicious occasion, when the journal, having reached its fiftieth year of publication, is now celebrating its Jubilee.

Having for so many years been somewhat closely connected with the paper as a result of writing for, and enjoying the friendship of its Editors, I have had ample opportunity for witnessing its growth and development, or, in other words, have seen it attain first its majority and now its Jubilee.

Such a result cannot be otherwise than intensely gratifying both to its founder, Mr. W. Robinson, and the present owners of GARDENING ILLUSTRATED. Founded in 1879, it has enjoyed a long and successful career, widely circulating among amateurs and others, for whose particular needs it has always catered, and being, moreover, as its pages evince, so frequently and freely adorned with illustrations depicting garden scenes, portraits of plants, and so forth, it has not only attained a high standard of efficiency, but fully justifies its title.

Many important changes have taken place with regard to the Royal Horticultural Society since or during the period under review. For instance, Mr. Barron, the Superintendent at Chiswick, retired, and was succeeded by my esteemed friend the late S. T. Wright, who held the post first at Chiswick and afterwards at Wisley with great success. The National Pear and Apple Conferences were held in Mr. Barron's time, but the Vegetable Conference took place under Mr. Wright's superintendence. Then began the holding of those wonderful shows in the Temple Gardens, Holland House, and after the abandonment of the Temple shows those held in the Hospital grounds at Chelsea with such remarkable success every spring. The great autumn fruit shows were held at Crystal Palace and afterwards in the Hall, Vincent Square.

With the presentation of Wisley to the Society, Chiswick was finally vacated. Personally, I was sorry to leave it and its old associations.

A. WARD.

Shading greenhouses in spring

Few people appreciate how helpful it is to shade some portion of the house, at least in spring, especially where young plants and seedlings are being pushed on for outdoor growing. Those who have greenhouses know full well that in March and April a few hours' sun will cause the thermometer to soar, and young seedlings, especially those on shelves near the glass which may have only germinated a short time, are liable to become dried and scorched. It is not suggested that a "wash" should be applied to the glass so early, but one can at all events manage to give them temporary relief from heat, even if it is only by sheets of paper fixed over pans and boxes. I have found strips of muslin to answer very well, and if hooks and eyes are used one can soon fix up and take them down without much trouble.

MY GRANDMOTHER

By Sir William Lawrence, Bart.

Volume 68 (1842) of "Curtis' Botanical Magazine" is dedicated

To

MRS. LAWRENCE,

of Ealing Park, Middlesex,
the beauty of whose gardens and pleasure grounds,
and whose
most successfully cultivated vegetable
treasures are only equalled by
the liberality with which they are shown to
all who are interested in
Botany and Horticulture,
the present volume is dedicated,
with sentiments of great regard and esteem,
By her faithful and
obedient humble servant,
W. J. Hooker.

Royal Botanic Gardens, Kew,
August 1, 1842.

EALING PARK is situated in the centre of what was called until recently Little Ealing, between Brentford and South Ealing Station. The house remains, and from the time it was sold by my father and his sisters in 1869 it has been in the hands of various Roman Catholic communities. At present it is occupied by the community of St. Vincent de Paule. The Mother Superior, a charming person, who is interested in gardening, showed me round the house and what remains of the garden nowadays. Some of the colonnade of the Italian Garden is still standing with a melancholy Magnolia; the garden of about 2 acres to 3 acres is given up entirely to vegetables; the dairy, an elegant octagonal structure, is still there, but the charming pond has long since been drained. The famous avenue of Deodars, to which reference is made below, has long disappeared, but there are still in the vicinity one or two fine Cedars and Ilexes which must have been in the Park.

During the decade 1840-1850 Mrs. Lawrence was the most famous gardener of her age. At Ealing Park she gave great afternoon parties, when the carriages stretched for a mile and a half along the London road. To these parties came from Windsor or Buckingham Palace Queen Victoria and the Prince Consort, and it was in the early 'forties, when the Night-flowering Cactus was about to flower for the first time in this country, that my Grandmother arranged to send a groom to Buckingham Palace as soon as the great event was imminent; the Queen and the Prince Consort arrived at Ealing Park at 9 in the evening, and were duly rewarded. From Kew Palace, half a mile away, came the Duchess of Gloucester and
the Duchess of Cambridge, and the crov
heads who were wont to lunch with
Duchesses at Kew would go thence to
House to see the Duke of Northumberla
collection, and take tea afterwards at E
Park. The King and Queen of Belg
the King of Saxony (a great botanist),
King of Hanover, Princess Sophia,
Grand Duchess of Mecklenbourg, the D
of Cambridge, Gloucester, Buckingham
Chandos, Devonshire, Northumberland,
ford, the Duchesses of Montrose and
Inverness, and the Marchioness of Lon
derry—all keen gardeners—were freq
visitors.

As the extracts given below show, my gr
mother's correspondence on plants was
interesting, and it is a matter of great re
that so few of the letters written to her
been preserved.

Mrs. Lawrence of Ealing Park

AMHERSTIA NOBILIS

There was great rivalry between E
Park, on the one hand, and the Duk
Devonshire at Chiswick and Chatsw
My Grandmother scored the first point in
game by flowering Amherstia nobilis in
and the Duke of Devonshire writes on M
19th, 1849:—"I cannot refrain from wr
to congratulate you on your success in flo
ing Amherstia nobilis. Although it has
for many years a severe disappointmen
me that my tree has not flowered, I ca
but rejoice that you have proved that
to be accomplished—though perhaps
only your skill and management that
succeed.

"I am going to call at Ealing Park
morning, but not in expectation of seeing
plant—which, however, when in its pe
tion, you will allow me to look at, with
rest of the admiring world.

"Dr. Lindley informed me that he u
stood it was by excessive moisture and
that you accomplished the *great event.*"

Two years later the plant seems to
flowered again, and on January 15th,
the Duke writes:—"I am enchanted b
magnificent branches of Amherstia, an
is Mr. Paxton, who arrived last night in
to see the flower in perfection. I hope
I am not doing wrong in taking them
me to Brighton, where I think for se
days they will retain their beauty."

And again in an undated letter:—
thousand thanks, my dear Madam. I a
astonished at the beauty of the flower
that it has opened. It is very kind of y
send it to me, though I should have r
any degree of cold for the pleasure of s
it."

Lord Hardinge, who was then Gove
General of India, was naturally interest
this plant, which he introduced to this
try from Calcutta in 1847, and of whic
writes in 1849:—"I was delighted to re
your beautiful specimen of the Amh
which I took this morning to Bucking
Palace, but Her Majesty had gone to W
sor, and, as it was useless to forward
delighted Lady James with the sight of

"In the Calcutta Garden the flowers a
greater length, but certainly not larger
I congratulate you on your triumphant
cess in being the only person who has
it flower in Europe." And:—"I am
lighted that your scientific treatment o
Amherstia should have been crowned
success for the first time in Europe.
Duke of Devonshire, and the greate
horticulturists, Mr. Paxton, may be jea
but comparing the state of your plant

at of H.M. at Kew at the time each arrived the country there can be no doubt as to e cause of your victory.”

Amherstia nobilis now flowers regularly in o. 1 House at Kew, and I believe the plant a descendant of the original plant intro-uced into this country in the ’forties. Of its eauty I can but quote Nicholson, who says : “ A stove evergreen tree of almost unsur-assed magnificence and brilliancy . . . no bject in the whole range of the vegetable ingdom presents a more striking aspect an this tree.” It was 11 feet high when first flowered at Ealing Park.

THE VICTORIA REGIA

The second point was scored by Chats-orth, where in 1849 Victoria regia flowered, nd the Duke writes :—“ Mr. Paxton has told e of the kind interest you have taken in e successful treatment of Victoria regia. It very beautiful, and has such varied interest at I hope you will come and look at it. ext Thursday another bud will open, and if ou) would come on that day and stay over riday you would be able to see all its hanges. I shall be delighted to show you lso some other plants worth your attention. . . . The express train to Amber Gate, aving London at 9, will have orders to op at that place; you then rail to Rowsley, here a carriage will meet you—this is in-erring that you can do without your own arriage—and in my empty house you will ot need une grande toilette.”

My Grandmother, however, did not make e journey, as ten days later the Duke rites :—“ I regret extremely to find that ill-ess was the cause of your not coming. Sir illiam Hooker, on his arrival, told me he ared it was impossible you should come, d your most kind letter arrived this orning.

“ You expressed so cordially your readiness take the trouble of so long a journey that shall look forward with great pleasure to u doing so at a future time and in more vourable season.

“ The sixth flower was to have opened last night, but did not, being evidently disappointed in not seeing you—and this very dark morning makes me almost fear that Sir William may not see its glories.”

On January 28th, 1850, Paxton writes :—“ The Victoria regia is in a very flourishing state with us at Chatsworth, and continues to flower finely; the leaves are also again increasing in size. It is, however, very difficult to judge yet of its habits, whether annual, biennial, or perennial, but I should judge the latter. We have a quantity of fine seeds sown, so that should it prove annual I trust it will not be lost to the country.

“ I regret to learn that nearly all the plants around London are gone or going, but hope you are more successful at Ealing.”

Mr. Paxton was the famous gardener and architect who constructed the Great Conservatory at Chatsworth, now demolished, and subsequently planned the Crystal Palace.

Deodars at Ealing Park

THE LOTUS

Nor was the Duke of Northumberland at Syon House backward. His triumph was the Lotus (Nelumbium speciosum), and on October 4th, 1841, the Duchess writes from Alnwick Castle :—“ We have just heard from Syon that the Nelumbium is again going to blossom, and the Duke will direct the gardener to inform you when it has expanded, as it is so short a time in a state of perfection.” Whether my Grandmother saw this plant in flower on that occasion is doubtful, for on September 21st, 1844, the Duchess writes again :—“ I received your letter in Wales, when I was unable to find a moment to tell you the Nelumbium had been some time out of blossom at Syon. I hope you will excuse the delay, and I shall not forget your wish to see it the next time any flowers appear. Our gardener is very sanguine on the subject, and thinks we shall have many more next year.” At that time both Syon House and Northumberland House were being shown, as there are several references by the Duchess to cards of admission and season tickets. An undated letter from Syon thanks Mrs. Lawrence for a plant of “ Clitonia,” probably “ Clintonia ” was meant. The Duke and Duchess were wont to return to Alnwick in the early autumn, as the Duchess expresses her surprise at finding “ The Roses and Strawberries still in high beauty ! ”

The Dairy Pond, Ealing Park

CONTRIBUTORS IN THE EARLY DAYS

By Robert W. Wallace, V.M.H.

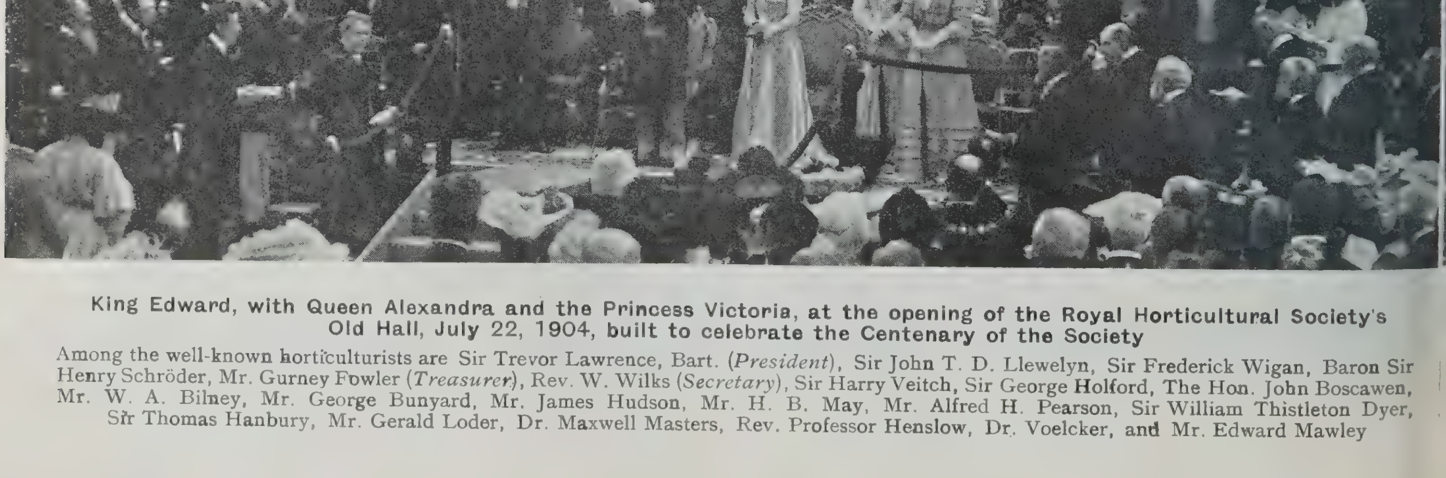
FIFTY years is a long period, especially nowadays, when matters move so fast and change succeeds change in almost unbelievable sequence. Horticulture has, however, moved with the times so much so, that the names of those who contributed in the early days to the pages of Gardening Illustrated and thus helped to lay the foundation of its success are, I suppose, almost unknown to the present-day readers.

To me there is no greater pleasure than to dip into the pages of the past in the paper under consideration and recall the many gardening personalities I knew of and in some cases met. Therefore at the risk, Mr. Editor, of incurring in some measure a feeling of "what is the old duffer writing about," I would like to mention some of the many eminent horticulturists connected with the early days of Gardening Illustrated. In the following remarks I shall refer to much that often appeared in the early pages of "The Garden" as well as Gardening Illustrated, which papers were, to all intents and purposes, both speaking with the same voice—the voice of "W. R." I well remember 37, Southampton Street, Strand, the early home of the paper, and every week the display of the current issues in the windows—"The Garden" with its coloured plates, Gardening Illustrated, and "Farm and Garden." I never went to Stevens's Auction Rooms or Covent Garden except by way of Southampton Street to have a look at the windows. Sometimes I found myself going up the small dark stairs to the little rooms above where, on certain occasions, was to be found "W. R." himself and some of his able henchmen, William Golding, W. P. Thomson, and later E. T. Cook, and in the 'nineties A. Herrington, one of the best writers in those latter days.

It is not necessary here to say much as to the aims and objects of these papers, but they seem to have gathered around them in the early days the support of all the professional horticultural writers as well as the leisured and cultured class who made hardy plant gardening their pastime and pursuit, and it is astonishing how free they were in contributing to "W. R.'s" pages the knowledge they possessed and notes about new and rare plants. Amongst the early writers was the late Max Leichtlin, of Baden-Baden, an enthusiastic cultivator and producer of hardy plants from all over the world. Everything he wrote was practical and to the point. I met him once in his garden at Baden, when, alas, he was in failing health. We have his name attached to many fine plants.

A great rosarian, Dean Hole wrote many scholarly and witty articles. I suppose there was no one at that date who did more for the Rose industry than his personal interest and writings. Amongst your present-day contributors is Mr. E. H. Woodall, of Nice, who knows more about Riviera gardens than most. I find him writing as long ago as 1879 and onwards—a fine record. Also it was a great pleasure to see him in London in good health at the last Iris Show, and your readers will doubtless remember a note from him on the show itself. Some of your many readers will remember the Rev. H. Ewbank, of St. John's, Isle of Wight. His contributions, especially on Irises and other semi-hardy bulbs, are to be found scattered throughout the 'eighties and early 'nineties. He was greatly interested in the cultivation of Oncocyclus Iris, and once, when visiting him at St. John's, he showed me, with great pride, a new frame he had had constructed for their culture, with a paved bottom, and, after flowering, the lights were to be put on so as to ensure a thorough baking-up of the rhizomes. I remember he showed me, with great pride, how he had wintered Vallota purpurea in the open by enclosing the neck of the bulb in a glass bottle. A grand Yorkshire gardener was John Wood, of Kirkdale, near Leeds, a great hardy plantsman. For many years he contributed excellent notes on hardy plants and their culture, and he started a very famous hardy plant club. I wonder what he would have said as to the recent correspondence on rock gardens in which his son has taken so prominent a part? I fancy he would have thought more of the plants in the rock garden than the stone which comprised the rock garden or its placing. I note frequent contributions signed "G. J.," wrote then, as now, on the necessity harmonious arrangement of the flo border and the beauty of simple p combinations for house decoration. G. F. Wilson, of Wisley, was a g plantsman. His development of Wisley always been a great inspiration and incen to natural gardening. From 1875 onwa hardly a season passed without mention his garden and the rare plants he grew, ticularly Lilies. How much do the pres day Fellows of the R.H.S. owe to his orig developments of the Wisley wood and opportunity afforded by "W. R." of rec ing from time to time progress of the w In "The Wild Garden," written over years ago, can be read one of the finest pictures of Wisley it is possible to imag The mention of the foregoing brings to m the Rev. C. Wolley-Dod, whose garden Edge Hall, Cheshire, was of great beaut masses of flowering plants and shrubs in set plan, but grouped, nevertheless, in a h monious setting in sloping lawns. His upright, grey-haired figure was always to seen at the Temple Show in the late 'nine with W. E. Gumbelton, F. W. Burbi and other keen plantsmen. He also w with great learning and charm. In your cent columns frequently appear interest notes from Col. A. H. Wolley-Dod, son the above. A few weeks ago he adv readers of Gardening Illustrated not take too much notice of what catalogues s but to go to the nurseries and see the pl for themselves. Read what his father w in July, 1892 :—

"In conclusion, I may advise those are forming collections of hardy herbace plants to do their best to visit the nurse at the time when what they intend to bu in flower, and if they are offended with appearance of any of the plants they h seen recommended not to buy those pla but at the same time not to condemn judgment of those who have recommen them unless they are sure that what has praised is the same as what they see be them.—C. Wolley-Dod."



King Edward, with Queen Alexandra and the Princess Victoria, at the opening of the Royal Horticultural Society's Old Hall, July 22, 1904, built to celebrate the Centenary of the Society

Among the well-known horticulturists are Sir Trevor Lawrence, Bart. (*President*), Sir John T. D. Llewelyn, Sir Frederick Wigan, Baron Sir Henry Schröder, Mr. Gurney Fowler (*Treasurer*), Rev. W. Wilks (*Secretary*), Sir Harry Veitch, Sir George Holford, The Hon. John Boscawen, Mr. W. A. Bilney, Mr. George Bunyard, Mr. James Hudson, Mr. H. B. May, Mr. Alfred H. Pearson, Sir William Thistleton Dyer, Sir Thomas Hanbury, Mr. Gerald Loder, Dr. Maxwell Masters, Rev. Professor Henslow, Dr. Voelcker, and Mr. Edward Mawley

A curious coincidence of the same train of hought expressing itself from father to son fter an interval of nearly 50 years.

One notices the initials of " F. W. B." ccurring continuously. The late F. W. Burbidge, of Trinity College Botanic Gardens,)ublin, was a fine, concise speaker, as well s a scientific writer on all garden subjects. n the early days he was one of those who ook great interest in the development of the)affodil, and was a very fine judge of the ame, frequently judging at the Bath Show n the late " R. S.'s " time. In 1884 the)affodil Conference took place, which led to nuch correspondence from W. B. Hartland, f Cork, Peter Barr, G. H. Engleheart, J. T. 3ennett Poë, and many others. This was at he time when Mme. de Graaf was first hown by Simon de Graaf, of Leyden, and reated such a sensation, especially when he sked five guineas a bulb, a price unheard of n those days.

" W. E. G.," or W. E. Gumbelton, of)ueenstown, was a frequent correspondent. Ie had a fine plant collection and was deoted to the trying out of all novelties. His vell-known expression, " a tish plant," was requently applied to new plants of little nerit. His correspondence was conducted n odd sheets of paper, but, for all that, he vas a most extraordinarily well-informed nan, from whom one could learn much. In the arly days we find occasional contributions rom G. Maw, the Crocus enthusiast. He reated once his impressions on seeing Chionooxa Luciliæ for the first time. Climbing he mountains one early spring in Asia Minor or Crocus he suddenly came across a snowovered plateau from which sprung myriads f Chionodoxa Luciliæ, forming a blue carpet, ne sight of which so overwhelmed him as render him speechless for some time. Ience the name " The Glory of the Snow."

On looking back one is struck with the umber of contributors " W. R." ranged round him in the early days of his publicaons. Learned men of culture, enthusiastic ardeners, all poured out their experiences eek by week. It seemed as if the hardy lant world of those days was asleep before W. R." awoke it with his voice crying out gainst the old Victorian bedding-out system nd the need of more extended recognition of ne value of the hardy plant, and his publicaons seemed to tune in with what so many hers were thinking at the same time that ney met with such instantaneous success.

I have mentioned but a mere handful of ose early contributors, but too many more ould be wearisome. The professional garn writer was, of course, fully in evidence— mention only a few, R. and A. Dean, G. ythes, R. P. Brotherston, of Scotland, . T. Fish, of Bury St. Edmunds, a prolific riter on Roses, E. H. Jenkins, of rather ter days, a clever writer, and W. Watson, Kew. It is no exaggeration to say that l the expert knowledge and practical exrience of those times was at the disposal of W. R." at the period I write of, testifying no uncertain manner to the popularity of publications. To those who have the oprtunity of reading from time to time the rly volumes of " The Garden " and GARENING ILLUSTRATED they can find no more joyable task than turning the pages over d reading of the times I have just menned.

In conclusion, may I join with others in e fact that " W. R." is still with us and le to enjoy the beauties of Gravetye.

otect wall fruits

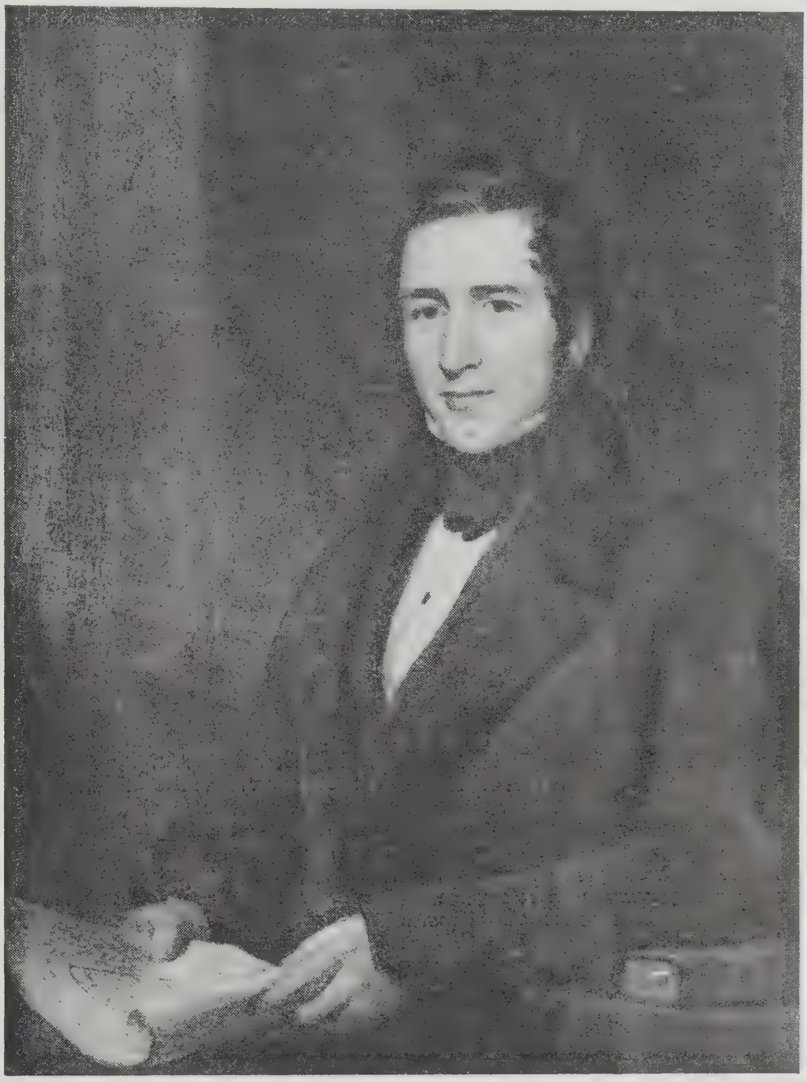
As soon as fruit blossoms begin to show lour some means should be adopted for otecting them from frost. Movable blinds e best, but a double ply of fruit netting ry often achieves the purpose.

Rose memories

By HENRY MERRYWEATHER.

When I was a boy, about 80 years ago, from memory the first Rose which caught my eye was a bloom of the old Moss Rose, lovely then, and it has not lost its charm today. In very early life I commenced to bud Roses, and the first was W. Jesse and Mme. Laffay H.P., Coupe d'Hébé, Charles Lawson, Chemdolle La Marylle Solfaterre, and what a charm had I when I first saw Souvenir de la Malmaison, Bourbon Queen, and others of that type.

Passing over many Roses we used to admire we come to the days of General Jacqueminot and Gloire de Dijon. About this time I heard a great admirer of Roses declare if he had committed any great offence and was only allowed to have one Rose it would be Gloire de Dijon. Fine Roses now began to make their appearance. I remember going to Caunton, and in the garden of the great Rose King I first saw Charles Lefebvre. Can you understand my feeling to see one of the finest Roses that ever saw light? And about this time came a great many beautiful varieties, and in their company came the finest Rose that ever was raised, and I venture to say will never be surpassed, and that is Maréchal Niel in its best form as I saw it here in the year 1863, for March 10th we cut 1,500 beautiful blooms to decorate a banquet in honour of the Prince of Wales' wedding. About this time a man came forward who started " G.I.," and, in his rambles, called to see me, in company with the Rev. S. R. Hole. That was Mr. W. Robinson. People wondered who is this Mr. W. Robinson? They quickly got to know a man of strong and splendid ideas of gardens and how to plant them, whose name will be heard for many years to come as the great garden reformer.



Sir Joseph Paxton

Employed in the gardens of the R.H.S. at Chiswick at 18s. a week in 1826, Paxton, afterwards to become Sir Joseph Paxton, attracted the attention of the Duke of Devonshire, who took him to Chatsworth. Here, between 1836 and 1840, he supervised the building of the Great Conservatory. In 1850 he submitted the successful design in the competition for the Great Exhibition of 1851, and two years later moved the building from Hyde Park to the Crystal Palace. He was made a Vice-Presideet of the R.H.S. in 1846. He died in 1865, aged 64. *(See page 182)*

Carnations from seed

If sown at once, in pans of light, sweet compost and set in a genial warmth, the resulting plants will, in most cases, bloom in autumn. Procure a reliable strain and then the percentage of good double flowers will be high.

The Evolution of the Daffodil Over Half a Century

By Albert F. Calvert, F.C.S., Author of "Daffodil-growing for Pleasure and Profit"

We have become so accustomed to the Daffodil as a flower with which we expect to renew acquaintance every spring that the younger generation, and, maybe, some of the older among us, may not fully realise the extent of the remarkable development that has characterised this flower during the last 50 years. This development, this great progress, forms a record of courage, sustained effort, patience, of disappointment and rewards, and culminating in the great industry of the present day.

It is unquestionably the effort of the raisers that has placed this country in the front rank of the industry in the matter of new creations, but, hand in hand with the raisers, distributors have well represented the commercial interests of this flower, for they not only have insisted upon a very high standard of excellence, but also have succeeded in popularising the cult of the Daffodil in the gardens of flower lovers. It is no mean achievement, for the duration of the time in which it has occurred has been very short compared with production, which must necessarily be slower, and, 50 years ago, there was hardly such a thing as production as we understand the term.

Up to approximately 1880 efforts seem to have been spasmodic and individual, and, too, were mainly concerned with the culture and understanding of existing species and varieties, but it was fully realised how chaotic things were. And so it remained until Baker classified the genus, a work which resulted in a revolutionary upheaval.

The classification completed and accepted as authoritative by the governing body of the Royal Horticultural Society, progress commenced upon well-organised lines. From now onwards the different divisions were "exploited" and explored, many experimental crosses were made, existing hybrids studied, and the foibles of all known species and varieties went under a searching scrutiny of men who devoted many years to the "task" which, to them, was a pure labour of love. When it is realised that from the inception of a new hybrid to its retail distribution, a period of at least 10 years is involved, it will be seen how patient must be the raiser, and this is not all, for the hybrid, though it may be passed, certificated, shown, and grown from seeds to bulbs in bulk, may not stand up to the strain of commercial cultivation, and it may be superseded by another that might take the public fancy more readily. There are, in fact, very few "best sellers" with new Daffodils. Even now, when possibilities are quickly sifted by the keenest brains of the industry, I think many of the raisers would admit that their pleasure is mainly æsthetic and is derived from sheer love of the subject. Albeit, during the past half-century many hundreds of new hybrids have graced the genus, and many are as yet just numbers awaiting the verdict of judges as to their fitness and worthiness to bear a name.

In 1875—54 years ago—Messrs. Burbidge and Baker created the nucleus of a movement with Daffodils, which has expanded so rapidly as to become world-wide in interest and authority. Under the auspices of the Royal Horticultural Society, at a conference held in London in 1884, the work of the two enthusiasts referred to was officially recognised, and the matter of uniformity of nomenclature finally settled. Interest never waned, but grew apace. From 1886 to 1890 and onwards the Narcissus and Tulip Committee of the R.H.S. met during the opening months of each year, and the men who formed the Committee tabulated, added, and erased until complete order reigned.

As a climax to all this continuous effort, in July, 1890, a great Daffodil Conference was held in London under the chairmanship of Professor Michael Foster, who said, in opening his address to the delegates, "that the prime duty of this conference is to take care of the beauty of the Daffodil." Hybrids in great numbers from all parts of the United Kingdom turned up, garden varieties, hybrids, seedlings, and selected wild forms were submitted for adjudication. This 1890 conference was held primarily with a view to reporting progress, as well as to deal adequately with a process of sifting out, which was regarded as necessary in view of the multiplicity in naming and in dealing with the small variations in character of similar varieties and hybrids likely to cause confusion in nomenclature. Even in 1890, at the Chiswick Show of that year, over 300 named hybrids were exhibited, so it will be seen how necessary was some check upon indiscriminate christening of new varieties.

Hand in hand with this great work of classification, which, because of its meticulous exactness, gains many tributes from the trade, practical trials were conducted at Kew. Thus a check was placed upon the possibility of the same form being brought out and distributed by different people under different names. Sometimes variations in character occurred with the same variety growing under different climatic and geological conditions, so, on the matter being referred to the R.H.S. tribunal, trials of the two or more types at Kew would settle the matter for all time, and, too, further facts were learned as to the behaviour of certain varieties under certain conditions. In this way was our knowledge built up.

From 1890 to the present day progress has been consistent and steady. Resting upon a sound basis, each division of the flower known, and each floral characteristic recognised, development now became stabilised and commercial interests became involved. The public demanded the flower both in and out of season, and a host of other problems arose, mainly commercial, with which the grower himself had to deal with the help and guidance of the distributors, without whom, of course, the cut-flower industry could hardly exist as such.

Even in 1885 there was talk of "gluts" and "over-production," for Mr. James Walker, a noted Daffodil grower, of Middlesex, deplored a slump of 50 per cent. in prices in one season, and quotes English Daffodils as low as ninepence per dozen bunches. But Mr. Walker also says that 12s. had been obtained for the same variety and quantity, and at the same time. Such disparity of prices would hardly be possible in these days of swift transit and market intelligence. Though the standard demanded now is much higher than that of 30 years ago, still the older raisers were seriously hampered by their lack of material, tradition, and research knowledge. They, of course, *were* the researchers, they *were* the originators, and, as such, their results stand out the more clearly. Their difficulties were the greater, for it was not yet clear, nor definitely established, how some of the so-called species, hybrids, and varieties arose. The Rev. G. H. Engleheart in 1894, in a paper read before the R.H.S., discussed some of the difficulties he encountered in hybridising. Very few records were available, naturally, and as Mr. Eng heart then said, Messrs. Leeds and Ba house, from whom, with a few notable ceptions, we inherit this wealth of Daffodi "Have left a very imperfect record of th methods in detail."

But here is the point of my observations regard to Mr. Engleheart's work. Not bei content with this state of affairs, which the keen analytical mind was intolerable, keen and enthusiastic amateur forthw tackled the huge task of reconstructing the types with which he wished to exp ment, to quote his own words: "Theref I proposed to myself the task of attempt to 'make' all these flowers over again order to determine with certainty th origin."

There can be no gainsaying that some these old flowers—old they were even the have proved their merit as "stayers," can it be said that those who, in those d selected the flowers as "possibles," w wide of the mark in their judgment. As back as 1889, nearly 40 years ago, in a cussion upon the best varieties, the Rev. Wilks, who was a remarkably shrewd ju of all flowers, gave a list of 13 varieties w which he would re-commence should existing stock be destroyed. He was, said, governed in his selection by variety colour, season, form, constitution, and f dom of increase. This was the list:—

Double Telemonius
Recurvus
Horsfieldii
Cernuus
Barrii Conspicuus
Ornatus
Empress
Ardrigh
Sir Watkin
Emperor
Double Poeticus
C. J. Backhouse
Troilus

In these days, bearing in mind the grea number of types from which to select, e should probably extend the list and y greater attention to the breeding capabilit for, as Mr. P. D. Williams rightly says this list, though about half of Mr. Wilks varieties are to-day still good market flow s, it contains very little that is, or was, m h good to the raiser. Four of these variet still well known and liked on the mark were known and cultivated before 1884, Barrii, Emperor, Empress, and Horsfie and the first three were seedlings of B house, whilst, as is well known, Horsfi was raised by a Lancashire weaver na Horsfield.

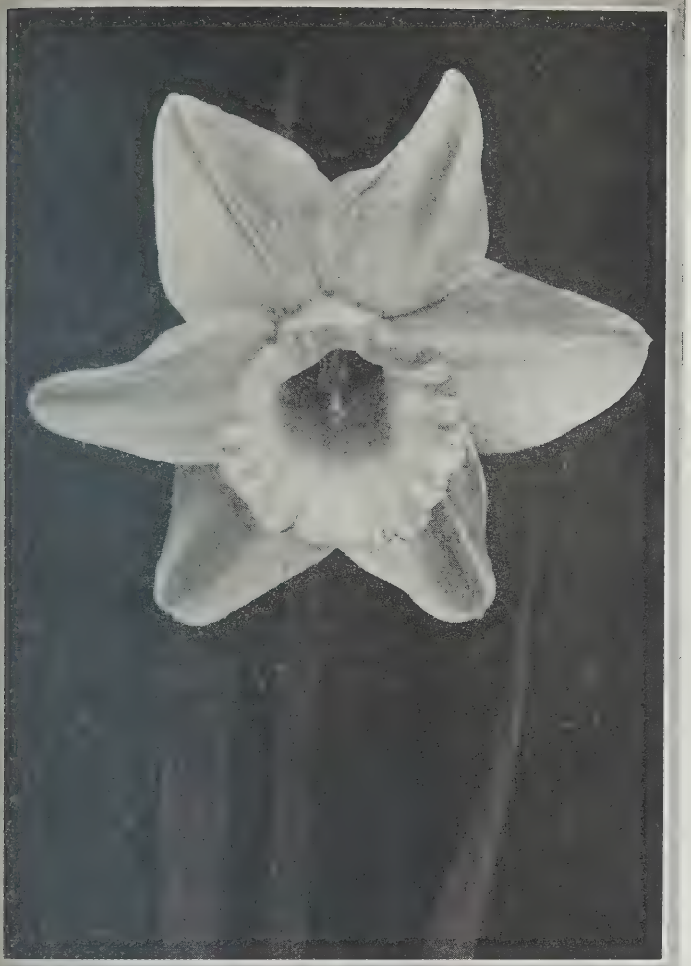
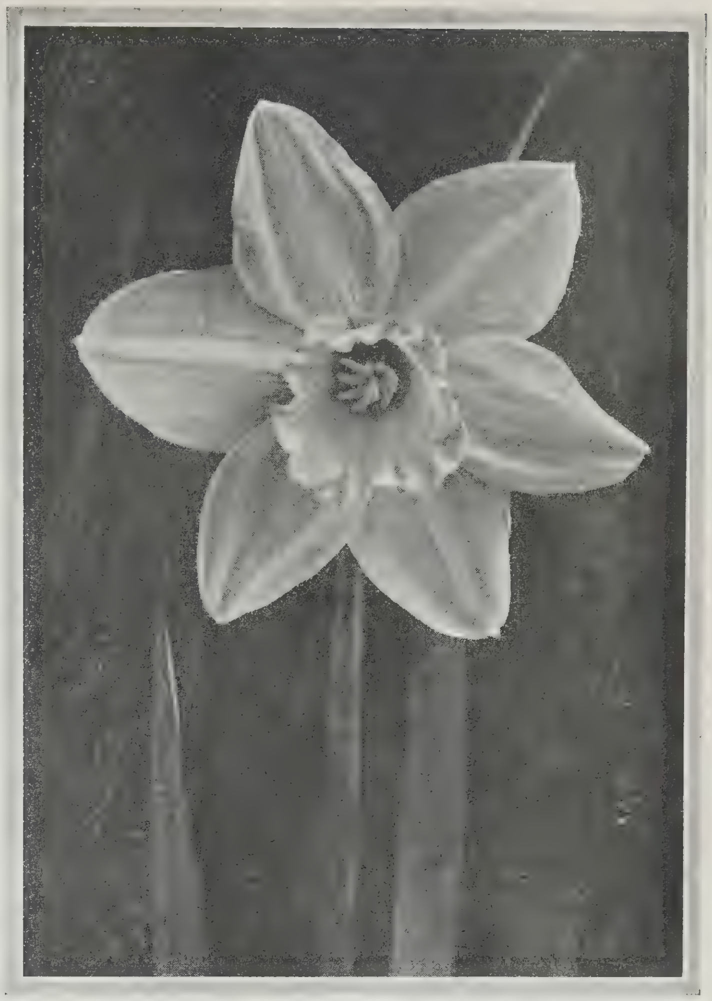
A good plant for the rock gar n

Incarvillea Delavayi is well known, I. grandiflora is a great improvement o It is a smaller growing plant, and there very suitable for nooks in the rock gar as well as a good plant for the border. bright rose Gloxinia-like flowers are produ in June and July and the plant attains height of about a foot. A very hands variety is brevipes, having large purp crimson flowers with markings of wh In both these plants the intensity of co is more marked than in I. Delavayi, their habit more compact. A good t to plant is in the winter as then the fl roots are dormant. A sunny spot suits th best and the soil should be deep, drained and not too heavy. Several g nooks may be found for the plant in the garden; a nice patch may be obtained planting half-a-dozen roots together. S are very fond of the crowns, and do g damage during the dormant season, therefore, a good layer of sharp sand should be put over them to keep them safe. F. I

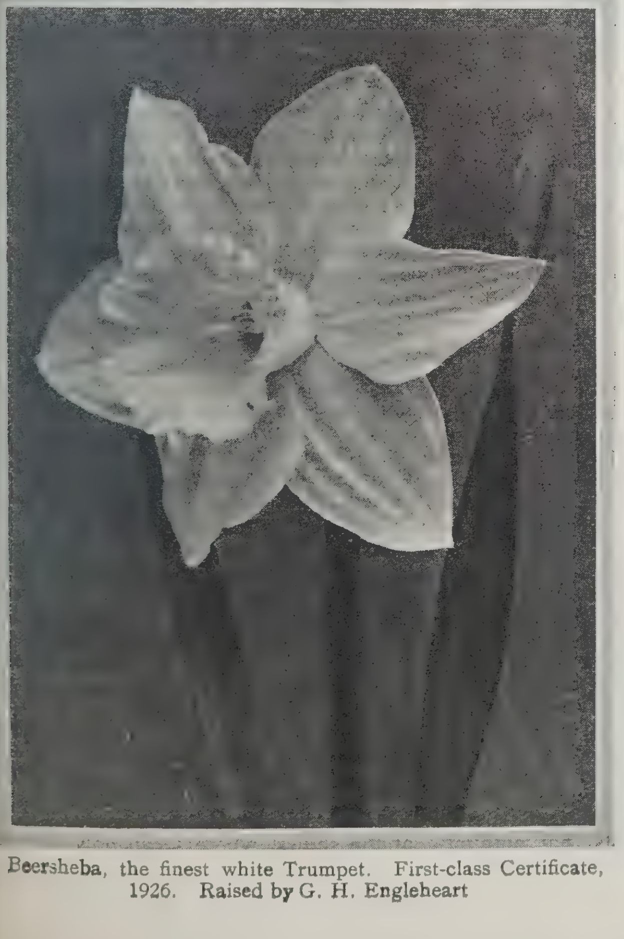




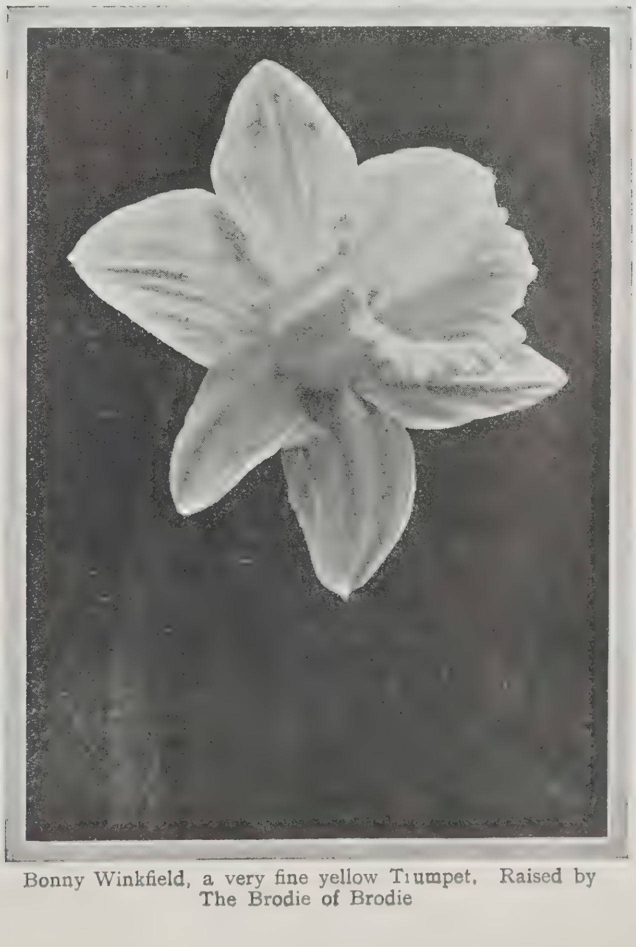
TWO NEW DAFFODILS RAISED BY THE BRODIE OF BRODIE

Brawardine, Award of Merit, 1928, a beautiful Leedsii of immense size and perfect form

Whiteley Gem, awarded Gold Medal by the National Gardens Guild, 1928. Similar to Fortune, but opening 10 days earlier



Beersheba, the finest white Trumpet. First-class Certificate, 1926. Raised by G. H. Engleheart



Bonny Winkfield, a very fine yellow Trumpet. Raised by The Brodie of Brodie

The Gladioli

Past, Present, and Future

By " East Anglian."

THIS is not intended to be by any means a complete historical record of the development which has taken place in Gladioli, but more or less notes at random which may be of interest to lovers of this beautiful flower. It is confined to the two most popular classes or types, the large-flowering group and the Primulinus hybrids. Gladioli have been grown for a great many years; indeed, they were known to the Greeks and Romans. Some trace the origin of their name to the word " Gladius " (or a sword), evidently derived from the shape of the leaves. In a book which I have just been reading it is stated that Gladioli may have been the " Lilies of the field " referred to in the Bible. Be this as it may, there are somewhere round about 150 distinct species, most of them natives of South Africa, but a few of Asiatic and European origin. Of course, all the popular varieties of Gladioli in existence have a very mixed ancestry, and probably a good many wild species have helped to " make " them. Beyond saying that our modern varieties have descended from the South African group, it is hardly necessary to give further details.

Hybridists have interested themselves in the flower for many years, and the credit of devoloping our present beautiful specimens is not confined to one country. Individual raisers in the past have not all worked on the same lines, and have used different material for their crosses. As a consequence, a few years ago the large-flowered varieties could be classified into various groups such as the Gandavensis, Nanceanus, Childsi, Lemoinei, etc. The distinctions which separated these classes and which gave them their individual character have now largely disappeared; they have been crossed and intercrossed, and although some of the old-time Gladiolus enthusiasts could no doubt say of a variety that " it followed the Nanceanus type," for instance, yet for convenience we have now come to look upon them all as large flowering. This is a good thing, for too many names of types which are not really pronounced only tends to confuse the grower. France, Holland, Germany, Belgium, America, Canada, and our own country have all contributed to the advancement of the Gladiolus, and more recently Australia has been taking a hand. Probably no other one wild species has had more far-reaching results on the flower than the finding and exploiting of Gladiolus Primulinus. In many ways the hybrids which have been obtained have made the Gladiolus as a flower more adaptable and more valuable. Gladiolus primulinus is a South African species which was discovered about a century ago growing very close to the Victoria Falls on the Zambesi River. It has one very distinctive feature, a hooded upper petal, which, no doubt, in course of time, was evolved to protect its essential organs from the heavy mist and spray thrown up by the Falls. The pollen, or fertilising agent, to be effective, must of course be dry, so Nature gave the bloom an " umbrella." This curious hood imparted a charming and rather graceful appearance, and to add to this daintiness the individual blooms were spaced rather widely on the flower stem, which was comparatively thin and wiry. The colour was a beautiful rich, clear yellow. By crossing Gladiolus primulinus with the larger-flowering varieties a new race was developed, which combined its best points with some of the colours found in the large-flowering kinds. The first hybrids, as might perhaps be expected, were mainly yellow, primrose, orange-yellow, orange-salmon, orange-scarlet, salmon-pink, scarlet, and buff. In the main they were bright and rich, rivalling the warm tones one finds in Begonias. The colour range is being gradually extended, and as the hybrids get farther away from the original Primulinus " blood," as it were, there has been a t dency for the size of the bloom to increa the placement to become closer, while in few instances the characteristic hood almost disappeared. This, then, is th brief outline of past development.

Sic Transeunt

I NOTE that in your Jubilee number you are to have articles " both prospective and retrospective." The prospective articles will be furnished, presumably, by young hands who have 50 years in front of them and are dreaming of future achievement, and the retrospective by oldsters with a solid half-century behind them, of which veteran band am I, who am writing you these lines of congratulation on your 50 years of good work achieved. I shall read the Jubilee number with interest, but with a special interest those articles that glimpse into the future and forecast the appearance of British gardens in 1979. Granted a succession of Februaries with frosts like those we experienced in February of the present year I could tell you what my own plot would look like long after I have myself become part of my native soil, usefully encouraging, perhaps, the tubers of some newly invented Potato. Plants which I have hitherto regarded as frost-proof, such as Thymes, Aubrietias, Wallflowers, Daisies, and Lavenders, will have vanished from cultivation as too tender for our climate, and a flora such as I conceive may flourish in the herbaceous border of an Iceland garden. P. nudicaule, Rubus arcturus, Arctic Primulas, and Mosses of sorts, including the Reindeer Moss, will take their place, with a background in the utility plot of Gooseberry bushes and Curly Kale. This, however, is too pessimistic a line of forecast. We are not going for ever so long, let us hope, to have spring frosts such as we have had this year. If we strike a moderate average there is little reason to doubt that the flowers, fruits, and vegetables of 1979 will be as great an improvement on those of to-day, as are those of to-day on those of the year in which Gardening Illustrated came into being.

I say this, hoping it will be so, though, to be quite honest, I cannot see how some of the flowers of the present time are to be improved upon, being already as beautiful as mortal and sinful man has any right to expect. That, however, is what I have been thinking and saying each year for the last 50 years, and each year has seen things which we thought the *ne plus ultra* of excellence left far in the rear. When I look back, for instance, on the Daffodils we had in 1879 (coloured illustrations of which may be found in Burbidge's monograph), and when I remember the ecstatic admiration each flower, as it unfolded, drew from those who saw it, I come to the conclusion that all delight is relative, the less good delighting us as long as there is no better in evidence, for it is not possible either to feel or to express a greater delight in the flowers of to-day, though they include, to mention only a few that grow in my own borders, Beersheba, White Nile, White Emperor, Moira O'Neil, Yukon, and others of similar quality, than we found in Emperor, Empress, Horsfieldii, Princeps, Lobularis, Mrs. Langtry, Minnie Hume, and Ornatus in the day of small things 50 years ago. If the half-century has taught me nothing else it has taught me this, to be cautious in concluding that the utmost limit has been reached in flower, fruit, or vegetable. But a fig for caution! It is possible to be over-cautious. We all have beliefs that nothing can shake. I believe, for instance, that Apple can be raised in the next 50 years, for that matter, in the next millennium, beat in flavour the old Ribston Pip though it would be easily possible to beat t venerable variety in vigour of constitution

Of the flowers which I grow on a not m than modest scale, but which I occasion see elsewhere in the prime of their bea there are few, I should think, that have m a greater advance in recent years than Delphinium—such glorious spires do we of exquisitely shaped flowers, single double, and of a blue that out-blues sea sky at their bluest, with combinations, a of colour that would have staggered mid-Victorian milliner—Cambridge-blue mauve, Oxford-blue on lilac, all shades blue on lavender—combinations that mi have looked questionable on a Victor bonnet, but which justify themselves so how in the living flower beyond the reach cavil. Though not myself a Delphinian am lost in wonder at the beauty of the flow that come my way from time to time, ask myself what could be more superb in the shades of blue than such flowers. shades of blue and related shades no flo could, but there is still room for fut hybridists to work new wonders, for we h not, so far, a handsome scarlet or yell spike, though we have scarlet species in cardinale and D. nudicaule, and a yell species which I have never seen and wh scientific name I forget. Its Persian na is Zalil.

The transformation in Chrysanthemu and Sweet Peas, to instance two widely similar families of cultivated flowers, dur your Jubilee period, or part of it, has been a kind to be realised only by those who h lived through it. From the old incurved Chr anthemum, prettily represented by the sno and spherical Mrs. Rundle and its yell sport, George Glenny, to the now fashiona Japanese periwig flowers, is a long str even for 50 years. As for the numerous a various single flowers of the Mensa type, n so deservedly valued for their grace a beauty, they would, not improbably, in 70's of the last century have been rejected raisers as failing to reach the florist's ide though they would very certainly have be cherished by any professors or pupils of Art schools who chanced upon them. Aga not many years ago the only available ea summer-flowering varieties were two, white Mme. Desgrange and its yellow spo George Wermig, and now look at the infin variety listed in every trade catalogue bloom in August and September.

As for Sweet Peas, which I have grow off and on, from the year in which you pu lished your first number, I look back with the pleasure of memory to the four or fi varieties I grew in that remote age, so ve pretty as I thought, so sweet-scented as know they were, so light and airy, yet small and so limited in their range of colou I have less pleasure now in growing Swe Peas, and, indeed, have ceased to grow the because I cannot grow any that will sta comparison with those of the specialist. Pe haps the pleasure is the greater to see the at the shows, where I can only wonder a dmire. And as I wonder I ask myself hether those great foot-long stems topped ith four, and sometimes five, gaily-coloured lossoms, all on tip-toe for flight, apparently, ke tropic butterflies—whether these can be f the same species with the flowers so much maller, yet, I think, not less sweet, that I sed to grow when GARDENING ILLUSTRATED as still young. But so, indeed, it is. They re of the same species, as the Shetland pony s of the same species with the Derby racer, r the Skye terrier with the mastiff.

Then there is the Rose. I have been a ose grower on a modest scale all my life, nd for me there is no flower that so emhatically marks the march of time as the ose. When I think of the old Hybrid Peretuals, celebrated by Dean Hole in his witty nd dithyrambic prose, and then look at a odern Rose garden ablaze with flamboyant ernettians and rampant Wichuraianas, it lmost feels like having lived in two ages—efore the Flood and after. The old Gloire de ijon is, no doubt, still grown in many laces, but for old sake's sake, I fancy, as uch as for its intrinsic worth. Even in the ardens of those who grow this Tea it is outlassed at every point by a host of climbing orms of all colours—Ramblers, climbing eas, and climbing Hybrid Teas—Lady Ashown, Mme. A. Chatenay, Lady Hillingdon, V. A. Richardson, Marquise de Sinety, Mme. lfred Carrière (this year, like GARDENING LLUSTRATED, celebrating its Jubilee), and thers. The Gloire has its virtues—it is easy manage, fragrant, and a continuous loomer—but its blooms are invariably uartered and are generally lumpy and illhaped. To speak of the Gloire is to think f its frequent companion and rival, Devonensis, that sweetest of sweet-smelling Teas. f only for its fragrance it is to be hoped that his Rose will not be allowed to become obsote; yet I miss it from the Rose lists. I canot think that there has been a Rose more weetly perfumed than Devoniensis since oses were first created. It is not a handome Rose, perhaps, when full-blown, but hat Rose is? We must take Roses as we ke other things that have stages of growth, st at the right stage, and the psychological oment for Devoniensis is at half-tide, when has left the bud, but not yet reached exansion. Its claims to distinction are its perme and its delicate colour—a milky-white uffused with that touch of green which, hen it is there, seems somehow to accenate the purity of white in flowers.

I suppose that not many grow Hybrid Peretuals nowadays, and growers who still lant them grow only a few outstanding arieties, and of these only one where they sed to plant a score. This decadence of the .P. cannot be put down to lack of beauty, ut is due, rather, to the fact that they have ot proved so perpetual as by their name they rported to be—a defect made patent by the lvent of the Hybrid Teas, which were found be not only better autumn bloomers, but ore varied and brilliant in their colouring. nd yet, when one thinks of it, within their heme of colour what lovely tints some of ose now obsolete H.P.'s possessed. Their imsons, for instance! It is, perhaps, rash suggest that the crimsons of the H.P.'s ave not so far been excelled—if they have en equalled—by the crimson shades of .T.'s. What dozen H.T.'s, to put it to the uch, can be paired off for the rich depth of eir colour with Alfred Colomb, Charles efebvre, Duc de Rohan, Fisher Holmes, ord Macaulay, Duke of Edinburgh, General cqueminot, Duke of Wellington, Pierre otting, Annie Wood, Prince Camille de ohan, and Louis van Houtte. Having flung e challenge I will pick up my own gauntlet d bring a dozen H.T.'s into the arena to ake their crimsons against the colours of the H.P.'s. These, then, are 12 red H.T.'s which I happen to know, more or less, at first hand:—Etoile de Hollande, Hadley, Covent Garden, Château de Clos Vougeot, General McArthur, Richmond, Hoosier Beauty, Liberty, Avoca, Edward Mawley, H. E. Richardson, and George Dickson. Which list has it? I have not the moral courage to decide.

It is curious that pure whites should be so scarce in H.T.'s, as, for that matter, they are also in the H.P.'s, though not so scarce as among the H.T.'s, among which latter I cannot recall any indubitable white except Mrs. H. Stevens. Among the Perpetuals there is the Druschki, a very lovely Rose at its best, but scentless. Also there was, and I hope is, Mme. Lacharme. Speaking of whites, I cannot help recalling, with affectionate regret, a white Rose I used to grow when your journal was in its first youth. Though usually classed and treated as a Hybrid Perpetual, it was, technically, a Hybrid Noisette. This Rose was called Boule de Neige, and fitly so called, for it was raised in France and was of a white as near to snow as Roses ever reach. Of exceptionally vigorous growth, with luxuriant, leathery, dark green foliage, apparently mildew-proof, this was a trim, neat Rose, full-petalled, but small—too small for the flower show. In its best form it might have passed for a sweet-scented Camellia. Further, it was not what is called a "summer Rose," but gave several crops of bloom in the season, flowering well into the autumn—the model of a robust bush Rose. My only cause of quarrel with Boule de Neige was its obstinate refusal to root from cuttings.

Pink, pale or deep, is, I suppose, the predominant colour among the Hybrid Perpetuals, for one flower of which colour I have still a tenderness, because it was my first love in Roses, though I am afraid that Baroness Rothschild, who must be 60 if she is a day, is now very much a "back number." Still, and for all that, I have a tender regard for the Baroness, and would still, with every confidence, pit the satin of her complexion against the rouge of the fairest of Hybrid Teas. I believe that the Baroness could still have held her ground but for the one defect, lack of the perfume which is now a *sine quâ non* in a Rose of the first water, such slaves have we become to one of our senses. Still, perfume of the right kind and in the right place is a great thing, and, though the Roman adage that "the best smell is no smell" may be true of many things, it is not true of flowers, least of all of Roses.

In wandering or maundering through a half-century of flowers I am afraid they are but few who can escape being tedious, for which quality in these lines I apologise. But to recall past Roses is to see visions and dream dreams. I now grow only a few of the newest Roses, but when you tell me that this is your Jubilee my dreams are of the Old Brigade, the bulk of them gone, though, happily, a few still linger, not superfluous, on the stage. No Rose can lead the Old Brigade so fitly as the venerable Maréchal Niel, followed across the stage, without standing on the order of their going, by others that have "done their bit"—Niphetos and Souvenir d'un Ami, Paul Neron and Mme. Berard, Celine Forestier, Coquette des Blanches, Senateur Vaisse, Giant of Battles, John Hopper, Elie Morel, Horace Vernet, Victor Verdier, the Wood family, the Jamin family, Queens, Princes, and Sultans, Dukes and Duchesses, Counts and Countesses, Madames and Missuses galore. Poor Old Brigade! Brave Old Brigade!

A. W.

The composing room

Probably few readers of a paper realise how much depends on the printers. It is interesting to record that "Gardening Illustrated" has been in the hands of the same printers during the greater part of its history. The above picture is of the composing room. In the foreground is Mr. R. S. Warrington, foreman printer of the Chancery Lane Printing Works, Ltd. He has been in charge of the putting to press of "Gardening Illustrated" for 25 years, and as an apprentice was connected with the printing of this journal since its early days

EASTER WEEK IN THE GARDEN

Southern and Midland

Annual flowers

Where quantities of these are required to replace spring flowers, sowings should now be made freely; well-drained boxes and pans are most suitable for the purpose. Quite a large variety of beautiful and easily-handled kinds are available, but a few of these resent disturbance at the root, and in such instances excellent results may be obtained from sowing direct in the open ground. Those best raised inside include Salpiglossis, Nicotiana, Stocks, Double Asters, Cynoglossum amabile (best treated as an annual), Carnations, Pansies, Cleome, and Verbenas. A start may also be made with the sowing of hardy and half hardy annuals on well-prepared soil in the open; the majority, however, should be sown early in April.

Rose pruning

A start may now be made with the pruning of Hybrid Teas and H.P.'s, the delicate Teas being left until a little later. A fairly safe guide for the beginner is to prune those of weak growth severely, and strong growers with a lighter hand, because a very strong plant is capable of developing a larger number of blooms than its weaker neighbour. First cut away all old weak growth, especially from the centre of the bush, and follow this by reducing the remaining growths to within a few buds of their base, an eye being given to the even balance of the bush when completed. With pruning completed, apply a surface dressing of bone-meal and fork the latter lightly in. The bed will then be ready for a carpet of Tufted Pansies, or dwarf annual flowers.

Border Carnations

If the plants have been thoroughly hardened, as advised in a former Calendar, they should now be ready for planting out in their permanent positions, which should have been previously prepared. Carnations are lime lovers, and land deficient in this should be given a dressing a little in advance of planting time; a distance of at least 1 foot should be allowed between the plants, otherwise layering in August becomes a difficult problem.

Old walls and ruins

These may be furnished at the present time with plants and seeds, but if plants are used care should be taken to prevent the air getting at the rear of the plants before the latter have established themselves. Harebells, Aubrietias, Erigerons, Flax, Lewisias, dwarf Pentstemons, Sedums, Encrusted Saxifrages, Oxalis floribunda, Lithospermums, Linarias, Helichryssum, Onosmas, and Alpine Phloxes love such positions, and Ionopsidium acaule, Platystemon californica, and Erinus alpinus (in its various shades) may be established by merely scattering a pinch of seed in the crevices.

Kitchen garden

Make a sowing of Peas every fortnight from this date, using round-seeded varieties until March is out. Those growing in pots and boxes in frames should be given abundance of air whenever climatic conditions will admit. The ground they are intended to occupy should also be freely worked.

Growing crops

Growing crops of Spring Cabbage, Broad Beans, Lettuce, Spinach, and Winter Onions should be hoed frequently when the soil is in a free working condition. A further planting of Early Potatoes may also be made on a sheltered border. A little air should be admitted to vegetables and salads growing in cool houses and frames as a preventative of damping, which sometimes proves destructive to young Lettuces.

Broad Beans

These may now be sown in quantity for the main crop, the rows being 3 feet apart, and the seeds sown in double lines 6 inches apart.

Roses in pots

These usually occupy cool houses until required for forcing into bloom, and having been pruned and potted into fresh soil, or top-dressed, as the case may be, should now be brought into gentle heat, a temperature of 55 degs. to 60 degs. being very suitable. Newly-started Peach houses or vineries are ideal for them at this stage.

Vineries

The early Hamburgh will now be ready for thinning, and unlike the densely-clustered and short-stalked berries of Alicantes and others are easily dealt with. It is a delicate business, nevertheless, at all times, and care must be taken not to bruise the tender berries even by brushing one's head against them. A small, forked stick will be of great assistance in holding out the shoulders whilst the inside berries are removed, and all berries with a tendency to point inwards should be cut away before completing. Give attention to the future shape of the bunches, and do not leave the berries too thick.

Peaches in bloom

These must be fertilised daily, and a warm but slightly drier atmosphere maintained, with a little air admitted during favourable hours. Watering at this period must be curtailed, although the trees should not be permitted to become unduly dry at the roots at any time.

East Grinstead, Sussex.

Scotland

Planting Gladioli

By the time this appears in print the ground will probably have become favourable for this and many other outdoor operations. The Gladioli demand deeply worked and liberally enriched soil if they are to give of their best. In planting the corms, a good handful of clean, coarse sand should be placed under each to ensure a dry bed and an encouragement to root easily and quickly.

Rose planting

I have successfully planted Roses as late as March 15th, so if any are still requiring to be got in, it is still possible to plant, though it is not desirable to leave this so late, if it can be avoided. Prune the bushes well back, just before planting, or immediately afterwards. Should April and May, by any chance, be dry, it will be necessary to give an occasional soaking of water, so that the roots may be encouraged to take a good hold of the soil, before summer sets in.

The herbaceous borders

The bulk of the occupants should now be showing through the soil, so a general tidy up should be given. First remove all winter debris and reduce to reasonable dimensions any of the clumps that may be taking up more than their fair share of space. Any gaps should also be made good. If some well-rotted manure can be spared, spread it between the plants and then lightly point the whole surface, making all tidy and workman-like, but avoid using a rake.

Making new perennial borders

On heavy, retentive soils, the present
very suitable time for laying down new
or borders of these popular flowering pla

digging is finished, it will be necessary
tread down the bed before beginning to pl

Herbaceous Calceolarias

Plants wintered in 5-inch pots should
be moved into the flowering size, usin
good substantial compost. Good plants
be grown in 6-inch pots, but the 7-inch
is better, providing the plants are str
and healthy. The less fire heat this plan
subjected to, the better it will thrive. Me
exclude frost.

Begonia Gloire de Lorraine

This useful winter-flowering plant sho
now have attention. A moist warm atm
phere is essential, and as soon as the yo
growths get long enough, they should
taken off and inserted in small pots fi
with a light peaty compost. Plunge i
little bottom heat and keep shaded from
sunshine. For filling hanging baskets, so
of the healthiest of the old plants should
retained and carefully repotted.

Onions

There is still just time to sow seeds of th
in the open, but if delayed much longer
season will be too brief to enable it to
much good. Autumn-sown plants should
transplanted to rich ground, taking care
to put in too deep. Onion sets should
planted now, and as they are bad for thro
ing themselves out of the ground, a wa
should be kept and any showing signs
rising out of the soil should be pushed b
and made firm.

Broccoli and Cabbages

These have had a trying time since
year came in, and I fear the mortality
be considerable. As soon as the ground
a little dry on the surface go carefully o
both kinds, removing all dead foliage
then well hoeing or lightly forking the wh
surface between the plants.

Peas and Broad Beans

Any fortunate enough to have got in
early sowing last month should now m
another so as to maintain an unbroken s
cession, while those growers who have
to make a first sowing should seize the fi
favourable chance.

Border Chrysanthemums

Should stocks be short, a further ba
of cuttings should be secured, but the earl
such work is now finished the better. Earl
batches, if nicely rooted, should be moved
a cold frame, where they must be kept pre
close for a few days, but afterwa
abundance of air should be admitted on ev
favourable occasion.

Plants wintered in frames

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

TREES AND SHRUBS

Erica damaged by frost

(Mrs. J. Humphreys).—The Heath of which you send a spray is Erica mediterranea, and, like a great many others, this year it has been severely damaged by frost. Groups of both this and other species have been split about in a sad way, just as if someone had deliberately slashed them with a stick, both old and young shoots splitting in all directions, and even falling to the ground. The best treatment of such plants is to cut them back to within 12 inches of the ground and thus encourage new growth from the base. Nothing so serious has affected these plants for over 20 years, although large masses were seriously damaged by snow last year. These were treated as above, and are now nice, bushy plants. We therefore confidently recommend you to do the same.

Bays in tubs

(Regular Reader).—If the balls of earth have been frozen right through it is just possible that your plants have been killed. For filling in the cracks we suggest you mix up a little clay to the form of a paste and apply with a brush, working it well into the cracks of the trunk, afterwards binding hessian firmly around the trunk to keep the clay in place. It will help matters if this is moistened from time to time. They may be stood in the open about the second week in April.

Spineless Hollies and best month for planting same

(Oxonian).—Green-leaved: Ilex Shepherdii and I. Hendersoni. Golden-leaved: Ilex Aquifolium laurifolia aurea, I. A. Watereriana, and I. aureo-pumilo. Silver-leaved: We know of none of this class which are spineless, but the following are among the most beautiful:—Ilex argentea regina, I. a. angustifolia, and I. Silver Broad Leaf. The first week in May is the best time for planting.

GREENHOUSE

Leggy Camellias

(A. N. P., Scotland).—You may, with safety, prune your Camellias back hard, and this should be carried out without delay. The plants should then be stood in a warm house where the temperature at night is 55 degs. to 60 degs., and shaded during the day. Water should be applied only with great care until the plants are seen to be breaking freely, but a syringing should be given twice on fine, sunny days. When the new growths are about an inch or two long shake out the plants, removing as much of the old soil as possible, and then proceed to repot firmly with a mixture of soil made up as follows:—Three parts good turfy loam and one part made up of well-seasoned leaf-mould, peat, and sharp sand, to which may be added a little bone-meal. Yes, it is advisable to plunge the pots in ashes in the open during the summer in partial shade, syringing the plants daily in order to keep down Thrips and Red Spider. Treat those with yellow leaves the same as those which have grown leggy. The drainage of these has probably been at fault.

FLOWER GARDEN

The Gladwin Iris (I. fœtidissima) not flowering

(Mrs. D. C. Morris).—This Iris, called fœtidissima from the smell of the bruised leaves, flourishes in the shade of woods and copses in well-drained soil of a sandy nature. Its flowers are inconspicuous, being of a dull purplish-grey, so that they often come out and fade unnoticed. Your plants will probably bloom in time, but we would advise planting a few at least in partial shade and allow them to form large tufts, following which you should be rewarded not only with flowers, but also its handsome scarlet seeds.

MISCELLANEOUS

Lawn grasses

I am sending you two bunches of grass and some earth as I am anxious to know why so much of this coarse, flat grass has appeared on a new lawn sown with best lawn seed.

F. M. G.

[We have examined your specimen turves and can find nothing wrong with them; in fact, for seedling grasses we consider that they are exceptionally good. The samples contained all the recognised good grasses for the purpose of lawn-making. It seems to us that your difficulty is that you have proceeded so far with your lawn-making with very satisfactory results, and all that is required now is to "fine down" the grasses, which are always vigorous from seed. The fining down process is as follows:—So soon as the grasses begin to make new growth the lawn should be mown with a scythe and then thoroughly rolled. Follow this treatment by going over the lawn with a lawn grass cutter, setting the knives very high at first. The mowing should be repeated at intervals of a few days, each time the knives of the machine being set a little lower. At about the third or fourth mowing you should have the grasses down to the necessary level. After each mowing the lawn should be rolled. When you have the grasses down to their correct level you should obtain some sand and sulphate of ammonia and dress the surface. Take seven parts by weight of sifted sand and one part of sulphate of ammonia and thoroughly well mix the two ingredients together, then apply at the rate of 4 ozs. per square yard. Repeat this dressing after an interval of three weeks. The top-dressing should be fine enough not to interfere with the knives of the machine, and, after application, should be lightly brushed into the turf with a besom, and if rain does not follow before you have again to cut the grass the mowing machine should be used with the collecting-box off. If you follow the treatment outlined above you should have a very satisfactory turf at the end of the season.]

NAMES OF PLANTS

J. J. H.—1, Cuphea Roezlii; 2, Pani
variegatum; 3, not recognised.

LATE NOTES

Delphiniums to plant now

The long and severe frost has cost
many losses in the garden. Efforts sh
now be made to replenish the flower bor
for summer effect. In this connection
draw attention to the effective Delphini
offered by Blackmore and Langdon, B
Among the varieties that should find a
in all gardens are Blue Boy, Millicent Bl
more, Mrs. Townley Parker, Mrs. Shi
Norah Ferguson, Mrs. H. Kaye, and
E. Lascelles. Planting may proceed at
now that the frost is out of the ground.

Seeds for distressed miners

The distressed Miners' Fund is recei
very practical assistance from various f
connected with the seed industry. For
stance, Ryders, the seedsmen of St. Alb
have already sent for dispatch to the
tressed areas no less than one thousand b
containing a splendid collection of Ryc
vegetable seeds. This is a very happy
spiration, which provides the means of
taining a goodly supply of health-giving v
tables during the coming summer.

EARLIER, BIGGER, BETTER CROPS OF FLOWERS, VEGETABLES, SALADS

WOULD it interest you to save from 50% to 90% of the seed sown and get far earlier, bigger, and better crops? That is what thousands of Amateurs are now doing with the CHASE CONTINUOUS CLOCHE.

Germination wonderfully improved

THIS year why not make your own climate and sow safely six or eight weeks earlier *in whatever part of the garden is most convenient*? Thus you get wonderfully improved germination and rapid, unchecked growth. Earlier flowers, vegetables, and salads mean a longer productive season—increased pleasure in gardening, and increased profit, too.

Miles of CLOCHES in use throughout the country

PROTECT 1929 sowings with the CHASE CONTINUOUS CLOCHE. All are taking up this great aid to successful culture. Last year alone customers called for miles of CLOCHES, and we are already working hard to meet the rush of REPEAT ORDERS coming in by every post.

Weeks EXTRA SUMMER *in 1929!*

THIS is the effect of the CHASE CONTINUOUS CLOCHE! You can sow safely six or eight weeks ahead. Then again the Cloches enable you to carry over many summer sown crops through autumn and winter. Thus the productive season in your garden is extended actually by months.

Sweet Peas and all Annuals remarkably successful

SOW all annuals where you want them to bloom, and protect with the Cloches. Thus you avoid root disturbance and get far better growth. Customers report really remarkable results with Sweet Peas. Half Hardy Annuals such as Stocks, Asters, etc., give far sturdier growth and bloom better and longer than those from boxes.

LOW *Carriage Free* PRICES

From 4¼d. per foot run of row.

OFFER "S"

A set of 108 "Seed-raiser" size Cloches, enough for a row 126 ft. long, for **45**/-, carriage free. Half quantity for **30**/-.

OFFER "A"

A set of 52 "A" size Cloches as above, to cover 60 ft. of row, for **45**/-, carriage free. Half quantity for **30**/-, and trial dozen for **17**/-.

OFFER "D"

26 "D" size Cloches as illustrated on the left, enough to cover a row 30 ft. long, for **45**/-, carriage free. Half quantity for **30**/-.

CARRIAGE.—The above prices include carriage to nearest Station in Great Britain. Irish and Overseas orders are sent Carriage forward at reduced prices. Please send post card for full price list.

Have you read "Protected Cultivation"?

THIS is our new handbook on the Chase Continuous Cloche system, and describes all sizes and types of Cloches, with valuable hints on culture. We have reserved copies which will be sent free to readers of "GARDENING ILLUSTRATED." Please do not delay application. Now is the time to get your Cloches for the best results this season.

The effect of Fisons' Champion Fertilizer on Beans. Untreated pot on left ; treated pot on right.

FISONS' FERTILIZERS

Will Increase the Yield of Your Garden

A SMALL outlay on Fisons' Fertilizers will enable your crops to be increased greatly, blooms improved, and the season extended.

It is most important when feeding Flowers and Vegetables to use perfectly blended, properly proportioned foods. This is secured by using Fisons' Fertilizers.

Expert advice is at all times available, free of charge.

FISONS'
CHAMPION FERTILIZER
for Potatoes and Vegetables.

Dig in 6 ounces to the square yard or 11 lbs. per rod when preparing the ground. Vegetable crops, particularly potatoes, respond so readily to this Fertilizer that the increased yield more than repays the cost of the Fertilizer. Full instructions sent with each bag.

PRICES IN BAGS :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**4/6**	**7/-**	**12/6**	**19/-**

FISONS'
CANARY GUANO
(A Compound Fertilizer).

The best Fertilizer for general use on Flowers, Fruit, Shrubs, and Pot Plants. Highly concentrated, and therefore economical. Safe to use. Apply in open weather to herbaceous borders. Hoe in 4 ounces to the square yard.

The apiary of to-day and a skep apiary as seen in every village 50 years ago

Fifty Years of Bee-Keeping

O rural industry in this country has
progressed more in the last 50 years than
that of bee-keeping. Down to the latter
of the last century the methods of keep-
bees had not materially altered, except
and there in the hands of a few
ntists, for the past thousands of years.
es similar to those in use at the time of
g Alfred were still to be seen in cottage
lens throughout the country.

he inside of these hives was a sealed
. The bees built their combs as and how
liked, and the inner working of the
ny was quite beyond the control of the
eeper.

he killing of the bees to obtain their honey
an almost universal custom. This bee-
ing, as it was called, used to take place
ng the months of August or September,
as soon as the honeyflow was over, and
a great event in the life of the cottager.
nall circular pit some 6 inches to 8 inches
was dug in a secluded part of the gar-
in this were placed a few rags dipped in
ted brimstone. At sunset, or as soon as
bees had ceased flying for the day, the
eeper commenced operations. A knife
gently run round under the edge of the
(the ancient name for a bee-hive) to free
om the stand on which it stood. It was
carefully lifted and carried, mouth
nwards, to the sulphur pit. The rags
ignited and the skep placed over the
. In a couple of minutes every bee had
shed, and the pit was ready for the next

he heaviest and the lightest skeps were
en for destruction; the heavy ones be-
e they contained most honey, and the
ones because there would be insufficient
in them to carry the bees through the
er. The medium weight skeps were
to restart the apiary in the following
g. Increase was entirely dependent
natural swarming.

his wasteful and cruel method of obtain-
honey meant not only the annual loss of
ast 50 per cent. of the beekeeper's stocks,
also the destruction of the valuable comb.
every pound of comb built by the bees
t 12 lbs. of honey has been consumed.

ter the bees had been destroyed the
s were cut from the skep and the honey
sed and strained out of them. As a large
ortion of this honey had probably been
d in cells in which several generations of
g bees had been reared it was very in-
r in quality to that produced under the
ern system.

ith the hive of to-day very different
iods are practised. In the first place,
g to the arrangement of movable combs
have almost complete control over a colony. We increase or decrease the size of the hive according to the needs of the bees and the state of the honeyflow. Natural swarming is largely eliminated, with the result that, whereas in the old days of the skep the beekeeper was well satisfied with 30 lbs. of honey per colony, to-day 100 lbs. is commonly obtained, and occasionally in a good season double this amount is taken, and this honey is obtained without the killing of a single bee and without destroying the comb.

With modern appliances in an up-to-date apiary the honeycombs are removed from the hive with practically no disturbance to the bees. They are uncapped, placed in an extractor (the honey is thrown out by centrifugal force), then returned to the hive for the bees to clean up, and later removed again and stored away for use the following season. Many beekeepers have combs that have been used annually for more than 20 years. In my own apiary I have some that were built in 1904 and are still in perfect condition. The high-water mark of British bee-keeping reached its climax last year, when at the National Show of Bees and Honey held at the Crystal Palace more than two tons of the finest honies in the world were staged, together with the best types of hives and appliances from all the principal dealers in the country. No old-time beekeeper who visited that show could have failed to realise the immense strides that had taken place during the last 50 years in this, the most ancient of all our rural pursuits.

The accompanying illustrations will give some idea of the contrast between an apiary of the last century and a modern one of to-day. L. Bigg-Wither.

FRUIT GARDEN

Ringing fruit trees

An interesting and useful research paper, "Some Observations on Ringing Fruit Trees to Increase Production," was contributed by Thomas Swarbrick to the Report of the Agricultural and Horticultural Research Station, Long Ashton, Bristol. This method has been practised for centuries in the Vine lands of Europe, and consists in the removal of a complete band of bark tissue from around a branch. The ring so formed may be of any width, but is no deeper than the depth of the bark, as no wood must be removed.

The ringing of fruit trees may easily damage them, and here the paper is very helpful. Stone fruit trees, it is recommended, should not be ringed, it almost invariably proving fatal for them. Apple trees, it was found, suffered from the death of the part above the ring if ringed in February or March, or any time before the bark slips. At Long Ashton from the middle to the end of May was found to be the best time. It is necessary, if the trees are to survive this treatment, for the rings to heal over, and a useful tip when they show a disinclination to do so is to cover the wound with adhesive tape.

The effect of the ring is that it interferes with the normal transference of the starches from the leaves into the root system, resulting in an accumulation of starch above the ring. This slows up the tree growth and leads to excessive flower production, and, usually, fruit crops. It does not take long for the new callus growths to heal over the wound and for starch transference to become normal again. Thus it will be seen that the main reason for adopting this practice, which is temporary, is to bring a reluctant tree into bearing. It is useful in the case of strongly growing trees that refuse to start cropping, but must never be used for weak-growing trees.

A strand of wire bound tightly round a branch will produce a similar effect, and in this connection it is pointed out that very often the cords used for tying young trees to the stakes have by the end of the season become too tight and are producing the effects of ringing. While this may do no harm to strong trees it will be seriously detrimental to the weaker trees. For this reason it is best at the end of the season to remove all the old ties and replace them with new ones.

Fruit in cottage gardens

I have urged for some years in my district the advisability of increasing the cultivation of fruit in cottage gardens on the ground that a nice succession of fruit in variety is quite as useful to the household as vegetables. I also do my best in my small way to advance the same by advice as to propagation, improved cultivation, prevention and destruction of enemies, selection of varieties, and the like. I was pleased to see largely increased exhibits of fruit at our local show, both in a natural and preserved state, the jam classes being particularly well filled. The Loganberry has advanced very considerably in favour of late years, its free and consistent bearing having been realised, and its value for jam-making appreciated. An improvised fence of upright stakes and horizontal bars keeps the shoots within bounds and facilitates the picking. The size and quality of Gooseberries have been much improved since growers realised the necessity of keeping their bushes well thinned out, encouraging the growth of young wood, and helping the bushes occasionally by a top-dressing of some good manure. By planting a few early and late varieties a long season is secured alike for Gooseberries and Red and White Currants. There is nothing better than the cordon system of culture where a fence of some kind is available, and it should be more generally adopted. Something in the way of rough posts is generally available in the country, and if tarred at the base before insertion in the ground, these will last for years. Fairly stout wood is cheap, and about four strands of this will suffice to keep trees in position and allow a good height of growth. Whether intended for growing as bushes or cordons, a small stock of young trees of all these small fruits should be kept on hand; if not required for new plantations they are very useful in replacing old, worn-out trees. Strawberries are seldom grown, for they are a precarious crop unless protected, the early spring frosts upsetting much prospect of fruit.

E. Burrell.

Hardwick.

VEGETABLES

Planting Potatoes

Many regard the planting of Potatoes as one of the most important of spring operations in the garden, more especially when it is more or less compulsory that a good winter supply has to be ensured. Are we not, the majority of us, in rather too great a hurry to begin planting? We do not take a warning from past experiences and go on, year after year, putting out our early varieties at a certain fixed date in March. Early planting in the case of Potatoes is as much to be deprecated as too late planting. Admittedly, in some seasons, both very early and very late planting may be a success; but, normally, early plantings suffer from late spring frosts and late plantings have not time to mature their growths before bad weather sets in. There are only a very few favoured districts in this country where it is safe for the growths to be well through the soil before the end of May—indeed I have seen much damage done by frosts at quite the middle of June. I would prefer to delay planting until the very middle of April at the earliest and continue to plant from that time until the second week in May. The drawbacks of too early planting are manifold. Heavy soil becomes so beaten down by rain and, possibly, by snow, that the growths can with difficulty make their way through the hard surface. Even when they do, the yield is likely to be small. The finer and looser that the soil can be kept the more bountiful the crop will be and the tubers will be more even. I am no advocate for the use of large quantities of farmyard manure for Potatoes, providing the soil is in good heart. In such a case I firmly believe manure does more harm than good. Even in poor soil I would limit the dressing, and I would apply it in autumn.

A Scottish Gardener.

Tomatoes in the open

When we have such a summer as that of 1928 there is no difficulty in growing heavy crops of well-ripened Tomatoes. Not only did the plants growing against sunny walls and fences produce grand crops, but those quite in the open succeeded nearly as well. Even self-sown plants left to take their chance gave a considerable weight of fruit, much of which ripened. We neither expect nor desire many such hot dry summers, but if we only get a good average season, then there is every likelihood of Tomatoes more than repaying for what little trouble is expended on them. If it should happen that more ripe fruit is forthcoming than is wanted for immediate use, any good housekeeper or cook ought to know how to store or otherwise utilise these, while the unripe fruit can be made into fairly good preserve and is excellent in a pickled state.

Rhubarb from seed

A large stock of plants may be quickly raised from seed, the only drawback being the uncertainty of the varieties sown coming true to name. It is quite possible to raise a batch of seedlings this year and force them next winter, but the seed must be sown at once in pans or boxes of fine soil, and set on a gentle hot-bed. When the seedlings are of good size they may be either pricked out thinly in shallow boxes filled with good soil, or, better still, be potted off singly into 5-inch pots. Having been kept in gentle heat till strong and well rooted, they may be hardened off and finally planted out some time in May. If the aim is to grow the plants large enough for forcing at once, give them a sheltered position and freely manured well-worked soil, putting them 2 feet apart each way. In dry weather they will need an occasional good soaking of water, also a surface mulching of strawy manure, this serving to enclose the much needed moisture at the roots. Seed may also be sown in the open ground, an east or west border being a suitable site; the drills to be drawn 18 inches apart and 2 inches deep, and the seed sown thinly; or, if preferred, broadcast sowing may be resorted to, the seed being covered with sifted soil. In this manner a number of strong plants will be obtained, these being suitable for transplanting the following spring. The first week in April is soon enough for open-air sowing.

Kale to be depended upon

To bridge over the time after the last of the Brussels have been gathered, until spring Cabbage is ready, a good plan is to sow, or plant at the right time, Kale. It is a most serviceable vegetable, and one which should receive more attention in the matter of variety, more especially those which yield from January to April. At a time, therefore, when seed can be sown, the attention of readers is called to some, that are proving their value: Scotch Kale, A1, and Hardy Sprouting. A few score of these planted out in summer in well manured ground cannot fail to be of good use in the early year, especially after a time of hard frost, which affects them but little. It is also worth mentioning that the old sort, Thousand-headed, like the others will provide very many sprouts for gathering over a long time, tender and of much acceptance when cooked. It matters little where the garden is situated, it is seldom that Kale disappoints. When planting out, it should be in well dug and well manured ground, and plants ought not to be stinted for space.

W. F.

Sowing Spinach

Although Spinach has never been popular like some other vegetables in provincial markets, more attention is now paid to it by private growers than formerly. Properly cooked, it makes a desirable acquisition to the table, and there is scarcely any garden where its culture cannot be undertaken. To grow it well, it should be given rich ground, in an open sunny situation, and seed ought to be sown at stated intervals so as to ensure cropping over a long period. To this end, ground needs to be well dug, and provided with sufficient humus, so that in the event of a dry summer it will not run to seed so quickly. For this purpose, good farmyard or stable manure is best; failing this manure or vegetable refuse that has stacked for a time should be worked as to provide the necessary humus. I there is an advantage in sowing bot Summer or Round and the Prickly or ter varieties. The first seed should be in March on a sunny border, partic where it is backed by a wall, and i sown very thinly in drills, or at any to get the thinnings transplanted early. trary to opinion of some, Spinach will transplanting. One often meets amateur gardeners who do not grow i give as their reason that "it takes a make a boiling," but that is only par truth, as it is in many instances thick ing and failure to thin that yields such results. If sown in rows a couple o or so apart it will admit of succes crops. Victoria and Longstanding R and the Prickly for late autumn and use, will ensure gatherings over the lo period. Spinach may be helped consid by being hoed, and in applications of manure administered. It is a quick gr crop, and one which the small grower not to lose sight of.

W

Celery and Celeriac

Seeds must now be sown in brisk h both Red and White Celery and Celeri the main crop, the resultant seedlings kept close up to the glass at all times pricked off when the third leaf has deve A warm, moist atmosphere is essential growth is advanced.

Are your Drives and Paths giving trouble?

DO you continually have to fill up the ruts caused by heavy rain? If so, we can mend them permanently with "COLD CHON." All you require to do is to pour "COLD CHON" on the paths, about one gallon to three square yards, cover it over with gravel, ash, or chips, and there you have your path as you would like it to look and remain; and it *will* remain because the "COLD CHON" is holding the surface tightly in its place.

NO FLOODS will have the slightest effect on your paths now. "COLD CHON" is cheap and the money saved on annual upkeep is considerable. As a skin is formed under the gravel it is impossible for weeds to appear.

Ardenconnel Avenue, Rhu, Dunbartonshire.

If you have a large area to treat, we will, at a small extra cost, send one of our men to lay the "COLD CHON."

Write to us for a booklet:

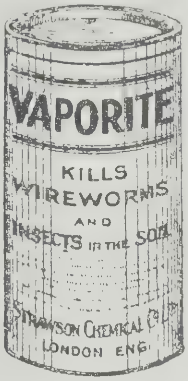
Carriage paid on cash orders

ANDON'S GRANULATED FERTILISER CO., LTD.

JUBILEE ROAD, WATFORD, HERTS.

All Insects in the Soil Killed

Even the best of seeds and the greatest of care will be wasted if insects in the soil attack your plants.



Now, when digging and preparing your garden, scatter some Vaporite upon the soil and work it in at the rate of about 1½ lbs. to every 10 square yards. In three days you will see the insects lying dead. The Vaporite is non-poisonous and pleasant to use. It is the standard Insecticide with the largest sale in the World.
